Appendix: Database Descriptions

Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ***Note:*** *Databases denoted with " * " indicates that the database will no longer be updated. See the individual database description for more information.*

Abandoned Aggregate Inventory: Provincial AAGR

The MAAP Program maintains a database of abandoned pits and quarries. Please note that the database is only referenced by lot and concession and city/town location. The database provides information regarding the location, type, size, land use, status and general comments.*

Government Publication Date: Sept 2002*

Aggregate Inventory: Provincial AGR

This database of licensed and permitted pits and quarries is maintained by the Ontario Ministry of Natural Resources and Forestry (MNRF), as regulated under the Aggregate Resources Act, R.S.O. 1990. Aggregate site data has been divided into active and inactive sites. Active sites may be further subdivided into partial surrenders. In partial surrenders, defined areas of a site are inactive while the rest of the site remains active.

Government Publication Date: Up to Nov 2023

Abandoned Mine Information System: Provincial AMIS

The Abandoned Mines Information System contains data on known abandoned and inactive mines located on both Crown and privately held lands. The information was provided by the Ministry of Northern Development and Mines (MNDM), with the following disclaimer: "the database provided has been compiled from various sources, and the Ministry of Northern Development and Mines makes no representation and takes no responsibility that such information is accurate, current or complete". Reported information includes official mine name, status, background information, mine start/end date, primary commodity, mine features, hazards and remediation.

Government Publication Date: 1800-Apr 2024

Anderson's Waste Disposal Sites: Private ANDR

The information provided in this database was collected by examining various historical documents which aimed to characterize the likely position of former waste disposal sites from 1860 to present. The research initiative behind the creation of this database was to identify those sites that are missing from the Ontario MOE Waste Disposal Site Inventory, as well as to provide revisions and corrections to the positions and descriptions of sites currently listed in the MOE inventory. In addition to historic waste disposal facilities, the database also identifies certain auto wreckers and scrap yards that have been extrapolated from documentary sources. Please note that the data is not warranted to be complete, exhaustive or authoritative. The information was collected for research purposes only.

Government Publication Date: 1860s-Present

Aboveground Storage Tanks: Provincial AST

Historical listing of aboveground storage tanks made available by the Department of Natural Resources and Forestry. Includes tanks used to hold water or petroleum. This dataset has been retired as of September 25, 2014 and will no longer be updated.

Government Publication Date: May 31, 2014

Automobile Wrecking & Supplies: Private AUWR

This database provides an inventory of known locations that are involved in the scrap metal, automobile wrecking/recycling, and automobile parts & supplies industry. Information is provided on the company name, location and business type.

Government Publication Date: 1999-Apr 30, 2024

Borehole: Provincial BORE

A borehole is the generalized term for any narrow shaft drilled in the ground, either vertically or horizontally. The information here includes geotechnical investigations or environmental site assessments, mineral exploration, or as a pilot hole for installing piers or underground utilities. Information is from many sources such as the Ministry of Transportation (MTO) boreholes from engineering reports and projects from the 1950 to 1990's in Southern Ontario. Boreholes from the Ontario Geological Survey (OGS) including The Urban Geology Analysis Information System (UGAIS) and the York Peel Durham Toronto (YPDT) database of the Conservation Authority Moraine Coalition. This database will include fields such as location, stratigraphy, depth, elevation, year drilled, etc. For all water well data or oil and gas well data for Ontario please refer to WWIS and OOGW.

Government Publication Date: 1875-Jul 2018

Certificates of Approval: Provincial CA

This database contains the following types of approvals: Air & Noise, Industrial Sewage, Municipal & Private Sewage, Waste Management Systems and Renewable Energy Approvals. The MOE in Ontario states that any facility that releases emissions to the atmosphere, discharges contaminants to ground or surface water, provides potable water supplies, or stores, transports or disposes of waste, must have a Certificate of Approval before it can operate lawfully. Fields include approval number, business name, address, approval date, approval type and status. This database will no longer be updated, as CofA's have been replaced by either Environmental Activity and Sector Registry (EASR) or Environmental Compliance Approval (ECA). Please refer to those individual databases for any information after Oct.31, 2011.

Government Publication Date: 1985-Oct 30, 2011*

Dry Cleaning Facilities: Federal CDRY

List of dry cleaning facilities made available by Environment and Climate Change Canada. Environment and Climate Change Canada's Tetrachloroethylene (Use in Dry Cleaning and Reporting Requirements) Regulations (SOR/2003-79) are intended to reduce releases of tetrachloroethylene to the environment from dry cleaning facilities.

Government Publication Date: Jan 2004-Dec 2022

Commercial Fuel Oil Tanks: Provincial CFOT

Locations of commercial underground fuel oil tanks. This is not a comprehensive or complete inventory of commercial fuel tanks in the province; this listing is a copy of records of registered commercial underground fuel oil tanks obtained under Access to Public Information.
Note that the following types of tanks do not require registration: waste oil tanks in apartments, office buildings, residences, etc.; aboveground gas or diesel tanks. Records are not verified for accuracy or completeness.

Government Publication Date: Oct 2023

Chemical Manufacturers and Distributors: Private CHEM

This database includes information from both a one time study conducted in 1992 and private source and is a listing of facilities that manufacture or distribute chemicals. The production of these chemical substances may involve one or more chemical reactions and/or chemical separation processes (i.e. fractionation, solvent extraction, crystallization, etc.).

Government Publication Date: 1999-Jan 31, 2020

Chemical Register: Private CHM

This database includes a listing of locations of facilities within the Province or Territory that either manufacture and/or distributes chemicals.

Government Publication Date: 1999-Apr 30, 2024

Compressed Natural Gas Stations: Private CNG

Canada has a network of public access compressed natural gas (CNG) refuelling stations. These stations dispense natural gas in compressed form at 3,000 pounds per square inch (psi), the pressure which is allowed within the current Canadian codes and standards. The majority of natural gas refuelling is located at existing retail gasoline that have a separate refuelling island for natural gas. This list of stations is made available by the Canadian Natural Gas Vehicle Alliance.

Government Publication Date: Dec 2012 -May 2024

Inventory of Coal Gasification Plants and Coal Tar Sites: Provincial COAL

This inventory includes both the "Inventory of Coal Gasification Plant Waste Sites in Ontario-April 1987" and the Inventory of Industrial Sites Producing or Using Coal Tar and Related Tars in Ontario-November 1988) collected by the MOE. It identifies industrial sites that produced and continue to produce or use coal tar and other related tars. Detailed information is available and includes: facility type, size, land use, information on adjoining properties, soil condition, site operators/occupants, site description, potential environmental impacts and historic maps available. This was a one-time inventory.*

Government Publication Date: Apr 1987 and Nov 1988*

Compliance and Convictions: Provincial CONV

This database summarizes the fines and convictions handed down by the Ontario courts beginning in 1989. Companies and individuals named here have been found guilty of environmental offenses in Ontario courts of law.

Government Publication Date: 1989-May 2024

Certificates of Property Use: Provincial CPU

This is a subset taken from Ontario's Environmental Registry (EBR) database. It will include CPU's on the registry such as (EPA s. 168.6) - Certificate of Property Use.

Government Publication Date: 1994 - Jun 30, 2024

Drill Hole Database: Provincial DRL

The Ontario Drill Hole Database contains information on more than 113,000 percussion, overburden, sonic and diamond drill holes from assessment files on record with the department of Mines and Minerals. Please note that limited data is available for southern Ontario, as it was the last area to be completed. The database was created when surveys submitted to the Ministry were converted in the Assessment File Research Image Database (AFRI) project. However, the degree of accuracy (coordinates) as to the exact location of drill holes is dependent upon the source document submitted to the MNDM. Levels of accuracy used to locate holes are: centering on the mining claim; a sketch of the mining claim; a 1:50,000 map; a detailed company map; or from submitted a "Report of Work".

Government Publication Date: 1886 - Aug 2023

Delisted Fuel Tanks: Provincial DTNK

List of fuel storage tank sites that were once found in - and have since been removed from - the list of fuel storage tanks made available by the regulatory agency under Access to Public Information.

Government Publication Date: Oct 2023

Environmental Activity and Sector Registry: Provincial EASR

On October 31, 2011, a smarter, faster environmental approvals system came into effect in Ontario. The EASR allows businesses to register certain activities with the ministry, rather than apply for an approval. The registry is available for common systems and processes, to which preset rules of operation can be applied. The EASR is currently available for: heating systems, standby power systems and automotive refinishing. Businesses whose activities aren't subject to the EASR may apply for an ECA (Environmental Compliance Approval), Please see our ECA database.

Government Publication Date: Oct 2011-Jun 30, 2024

Environmental Registry: Provincial EBR

The Environmental Registry lists proposals, decisions and exceptions regarding policies, Acts, instruments, or regulations that could significantly affect the environment. Through the Registry, thirteen provincial ministries notify the public of upcoming proposals and invite their comments. For example, if a local business is requesting a permit, license, or certificate of approval to release substances into the air or water; these are notified on the registry. Data includes: Approval for discharge into the natural environment other than water (i.e. Air) - EPA s. 9, Approval for sewage works - OWRA s. 53(1), and EPA s. 27 - Approval for a waste disposal site. For information regarding Permit to Take Water (PTTW), Certificate of Property Use (CPU) and (ORD) Orders please refer to those individual databases.

Government Publication Date: 1994 - Jun 30, 2024

Environmental Compliance Approval: Provincial ECA

On October 31, 2011, a smarter, faster environmental approvals system came into effect in Ontario. In the past, a business had to apply for multiple approvals (known as certificates of approval) for individual processes and pieces of equipment. Today, a business either registers itself, or applies for a single approval, depending on the types of activities it conducts. Businesses whose activities aren't subject to the EASR may apply for an ECA. A single ECA addresses all of a business's emissions, discharges and wastes. Separate approvals for air, noise and waste are no longer required. This database will also include Renewable Energy Approvals. For certificates of approval prior to Nov 1st, 2011, please refer to the CA database. For all Waste Disposal Sites please refer to the WDS database.

Government Publication Date: Oct 2011-Jun 30, 2024

Environmental Effects Monitoring: Federal EEM

The Environmental Effects Monitoring program assesses the effects of effluent from industrial or other sources on fish, fish habitat and human usage of fisheries resources. Since 1992, pulp and paper mills have been required to conduct EEM studies under the Pulp and Paper Effluent Regulations. This database provides information on the mill name, geographical location and sub-lethal toxicity data.

Government Publication Date: 1992-2007*

ERIS Historical Searches: Private EHS

ERIS has compiled a database of all environmental risk reports completed since March 1999. Available fields for this database include: site location, date of report, type of report, and search radius. As per all other databases, the ERIS database can be referenced on both the map and "Statistical Profile" page.

Government Publication Date: 1999-Mar 31, 2024

Environmental Issues Inventory System: Federal EIIS

The Environmental Issues Inventory System was developed through the implementation of the Environmental Issues and Remediation Plan. This plan was established to determine the location and severity of contaminated sites on inhabited First Nation reserves, and where necessary, to remediate those that posed a risk to health and safety; and to prevent future environmental problems. The EIIS provides information on the reserve under investigation, inventory number, name of site, environmental issue, site action (Remediation, Site Assessment), and date investigation completed.

Government Publication Date: 1992-2001*

Emergency Management Historical Event: Provincial EMHE

List of locations of historical occurrences of emergency events, including those assigned to the Ministry of Natural Resources by Order-In-Council (OIC) under the Emergency Management and Civil Protection Act, as well as events where MNR provided requested emergency response assistance. Many of these events will have involved community evacuations, significant structural loss, and/or involvement of MNR emergency response staff. These events fall into one of ten (10) type categories: Dam Failure; Drought / Low Water; Erosion; Flood; Forest Fire; Soil and Bedrock Instability; Petroleum Resource Center Event, EMO Requested Assistance, Continuity of Operations Event, Other Requested Assistance. EMHE record details are reproduced by ERIS under License with the Ontario Ministry of Natural Resources © Queen's Printer for Ontario, 2017.

Government Publication Date: Apr 30, 2022

Environmental Penalty Annual Report: Provincial EPAR

This database contains data from Ontario's annual environmental penalty report published by the Ministry of the Environment and Climate Change. These reports provide information on environmental penalties for land or water violations issued to companies in one of the nine industrial sectors covered by the Municipal Industrial Strategy for Abatement (MISA) regulations.

Government Publication Date: Jan 1, 2011 - Dec 31, 2023

List of Expired Fuels Safety Facilities: Provincial EXP

List of facilities and tanks for which there was once a fuel registration. This is not a comprehensive or complete inventory of expired tanks/tank facilities in the province; this listing is a copy of previously registered tanks and facilities obtained under Access to Public Information. Includes private fuel outlets, bulk plants, fuel oil tanks, gasoline stations, marinas, propane filling stations, liquid fuel tanks, piping systems, etc; includes tanks which have been removed from the ground.
Notes: registration was not required for private fuel underground/aboveground storage tanks prior to January 1990, nor for furnace oil tanks prior to May 1, 2002; registration is not required for waste oil tanks in apartments, office buildings, residences, etc., or aboveground gas or diesel tanks. Records are not verified for accuracy or completeness.

Government Publication Date: Oct 2023

Federal Convictions: Federal FCON

Environment Canada maintains a database referred to as the "Environmental Registry" that details prosecutions under the Canadian Environmental Protection Act (CEPA) and the Fisheries Act (FA). Information is provided on the company name, location, charge date, offence and penalty.

Government Publication Date: 1988-Jun 2007*

Contaminated Sites on Federal Land: Federal FCS

The Federal Contaminated Sites Inventory includes information on known federal contaminated sites under the custodianship of departments, agencies and consolidated Crown corporations as well as those that are being or have been investigated to determine whether they have contamination arising from past use that could pose a risk to human health or the environment. The inventory also includes non-federal contaminated sites for which the Government of Canada has accepted some or all financial responsibility. It does not include sites where contamination has been caused by, and which are under the control of, enterprise Crown corporations, private individuals, firms or other levels of government. Includes fire training sites and sites at which Per- and Polyfluoroalkyl Substances (PFAS) are a concern.

Government Publication Date: Jun 2000-Jun 2024

Fisheries & Oceans Fuel Tanks: Federal FOFT

Fisheries & Oceans Canada maintains an inventory of aboveground & underground fuel storage tanks located on Fisheries & Oceans property or controlled by DFO. Our inventory provides information on the site name, location, tank owner, tank operator, facility type, storage tank location, tank contents & capacity, and date of tank installation.

Government Publication Date: 1964-Sep 2019

Federal Identification Registry for Storage Tank Systems (FIRSTS): Federal FRST

A list of federally regulated Storage tanks from the Federal Identification Registry for Storage Tank Systems (FIRSTS). FIRSTS is Environment and Climate Change Canada's database of storage tank systems subject to the Storage Tank for Petroleum Products and Allied Petroleum Products Regulations. The main objective of the Regulations is to prevent soil and groundwater contamination from storage tank systems located on federal and aboriginal lands. Storage tank systems that do not have a valid identification number displayed in a readily visible location on or near the storage tank system may be refused product delivery.

Government Publication Date: Oct 31, 2021

Fuel Storage Tank: Provincial FST

List of registered private and retail fuel storage tanks. This is not a comprehensive or complete inventory of private and retail fuel storage tanks in the province; this listing is a copy of registered private and retail fuel storage tanks, obtained under Access to Public Information.
Notes: registration was not required for private fuel underground/aboveground storage tanks prior to January 1990, nor for furnace oil tanks prior to May 1, 2002; registration is not required for waste oil tanks in apartments, office buildings, residences, etc., or aboveground gas or diesel tanks. Records are not verified for accuracy or completeness.

Government Publication Date: Oct 2023

Fuel Storage Tank - Historic: Provincial FSTH

The Fuels Safety Branch of the Ontario Ministry of Consumer and Commercial Relations maintained a database of all registered private fuel storage tanks. Public records of private fuel storage tanks are only available since the registration became effective in September 1989. This information is now collected by the Technical Standards and Safety Authority.

Government Publication Date: Pre-Jan 2010*

Ontario Regulation 347 Waste Generators Summary: Provincial GEN

Regulation 347 of the Ontario EPA defines a waste generation site as any site, equipment and/or operation involved in the production, collection, handling and/or storage of regulated wastes. A generator of regulated waste is required to register the waste generation site and each waste produced, collected, handled, or stored at the site. This database contains the registration number, company name and address of registered generators including the types of hazardous wastes generated. It includes data on waste generating facilities such as: drycleaners, waste treatment and disposal facilities, machine shops, electric power distribution etc. This information is a summary of all years from 1986 including the most currently available data. Some records may contain, within the company name, the phrase "See & Use..." followed by a series of letters and numbers. This occurs when one company is amalgamated with or taken over by another registered company. The number listed as "See & Use", refers to the new ownership and the other identification number refers to the original ownership. This phrase serves as a link between the 2 companies until operations have been fully transferred.

Government Publication Date: 1986-Oct 31, 2022

Greenhouse Gas Emissions from Large Facilities: Federal GHG

List of greenhouse gas emissions from large facilities made available by Environment Canada. Greenhouse gas emissions in kilotonnes of carbon dioxide equivalents (kt CO2 eq).

Government Publication Date: 2013-Dec 2022

TSSA Historic Incidents: Provincial HINC

List of historic incidences of spills and leaks of diesel, fuel oil, gasoline, natural gas, propane, and hydrogen recorded by the TSSA in their previous incident tracking system. The TSSA's Fuels Safety Program administers the Technical Standards & Safety Act 2000, providing fuel-related safety services associated with the safe transportation, storage, handling and use of fuels such as gasoline, diesel, propane, natural gas and hydrogen. Under this Act, the TSSA regulates fuel suppliers, storage facilities, transport trucks, pipelines, contractors and equipment or appliances that use fuels. Records are not verified for accuracy or completeness. This is not a comprehensive or complete inventory of historical fuel spills and leaks in the province. This listing is a copy of the data captured at one moment in time and is hence limited by the record date provided here.

Government Publication Date: 2006-June 2009*

Indian & Northern Affairs Fuel Tanks: Federal IAFT

The Department of Indian & Northern Affairs Canada (INAC) maintains an inventory of aboveground & underground fuel storage tanks located on both federal and crown land. Our inventory provides information on the reserve name, location, facility type, site/facility name, tank type, material & ID number, tank contents & capacity, and date of tank installation.

Government Publication Date: 1950-Aug 2003*

Fuel Oil Spills and Leaks: Provincial INC

Listing of spills and leaks of diesel, fuel oil, gasoline, natural gas, propane, and hydrogen reported to the Spills Action Centre (SAC). This is not a comprehensive or complete inventory of fuel-related leaks, spills, and incidents in the province; this listing in a copy of incidents reported to the SAC, obtained under Access to Public Information. Includes incidents from fuel-related hazards such as spills, fires, and explosions. Records are not verified for accuracy or completeness.

Government Publication Date: 31 Oct, 2023

Landfill Inventory Management Ontario: Provincial LIMO

The Landfill Inventory Management Ontario (LIMO) database is updated every year, as the Ministry of the Environment, Conservation and Parks compiles new and updated information. Includes small and large landfills currently operating as well as those which are closed and historic. Operators of larger landfills provide landfill information for the previous operating year to the ministry for LIMO including: estimated amount of total waste received, landfill capacity, estimated total remaining landfill capacity, fill rates, engineering designs, reporting and monitoring details, size of location, service area, approved waste types, leachate of site treatment, contaminant attenuation zone and more. The small landfills include information such as site owner, site location and certificate of approval # and status.

Government Publication Date: Mar 31, 2022

Canadian Mine Locations: Private MINE

This information is collected from the Canadian & American Mines Handbook. The Mines database is a national database that provides over 290 listings on mines (listed as public companies) dealing primarily with precious metals and hard rocks. Listed are mines that are currently in operation, closed, suspended, or are still being developed (advanced projects). Their locations are provided as geographic coordinates (x, y and/or longitude, latitude). As of 2002, data pertaining to Canadian smelters and refineries has been appended to this database.

Government Publication Date: 1998-2009*

Mineral Occurrences: Provincial MNR

In the early 70's, the Ministry of Northern Development and Mines created an inventory of approximately 19,000 mineral occurrences in Ontario, in regard to metallic and industrial minerals, as well as some information on building stones and aggregate deposits. Please note that the "Horizontal Positional Accuracy" is approximately +/- 200 m. Many reference elements for each record were derived from field sketches using pace or chain/tape measurements against claim posts or topographic features in the area. The primary limiting factor for the level of positional accuracy is the scale of the source material. The testing of horizontal accuracy of the source materials was accomplished by comparing the plan metric (X and Y) coordinates of that point with the coordinates of the same point as defined from a source of higher accuracy.

Government Publication Date: 1846-Feb 2024

National Analysis of Trends in Emergencies System (NATES): Federal NATE

In 1974 Environment Canada established the National Analysis of Trends in Emergencies System (NATES) database, for the voluntary reporting of significant spill incidents. The data was to be used to assist in directing the work of the emergencies program. NATES ran from 1974 to 1994. Extensive information is available within this database including company names, place where the spill occurred, date of spill, cause, reason and source of spill, damage incurred, and amount, concentration, and volume of materials released.

Government Publication Date: 1974-1994*

Non-Compliance Reports: Provincial NCPL

The Ministry of the Environment provides information about non-compliant discharges of contaminants to air and water that exceed legal allowable limits, from regulated industrial and municipal facilities. A reported non-compliance failure may be in regard to a Control Order, Certificate of Approval, Sectoral Regulation or specific regulation/act.

Government Publication Date: Dec 31, 2022

National Defense & Canadian Forces Fuel Tanks: Federal NDFT

The Department of National Defense and the Canadian Forces maintains an inventory of all aboveground & underground fuel storage tanks located on DND lands. Our inventory provides information on the base name, location, tank type & capacity, tank contents, tank class, date of tank installation, date tank last used, and status of tank as of May 2001. This database will no longer be updated due to the new National Security protocols which have prohibited any release of this database.

Government Publication Date: Up to May 2001*

National Defense & Canadian Forces Spills: Federal NDSP

The Department of National Defense and the Canadian Forces maintains an inventory of spills to land and water. All spill sites have been classified under the "Transportation of Dangerous Goods Act - 1992". Our inventory provides information on the facility name, location, spill ID #, spill date, type of spill, as well as the quantity of substance spilled & recovered.

Government Publication Date: Mar 1999-Nov 2023

National Defence & Canadian Forces Waste Disposal Sites: Federal NDWD

The Department of National Defence and the Canadian Forces maintains an inventory of waste disposal sites located on DND lands. Where available, our inventory provides information on the base name, location, type of waste received, area of site, depth of site, year site opened/closed and status.

Government Publication Date: 2001-Apr 2007*

National Energy Board Pipeline Incidents: Federal NEBI

Locations of pipeline incidents from 2008 to present, made available by the Canada Energy Regulator (CER) - previously the National Energy Board (NEB). Includes incidents reported under the Onshore Pipeline Regulations and the Processing Plant Regulations related to pipelines under federal jurisdiction, does not include incident data related to pipelines under provincial or territorial jurisdiction.

Government Publication Date: 2008-Jun 30, 2021

National Energy Board Wells: Federal NEBP

The NEBW database contains information on onshore & offshore oil and gas wells that are outside provincial jurisdiction(s) and are thereby regulated by the National Energy Board. Data is provided regarding the operator, well name, well ID No./UWI, status, classification, well depth, spud and release date.

Government Publication Date: 1920-Feb 2003*

National Environmental Emergencies System (NEES): Federal NEES

In 2000, the Emergencies program implemented NEES, a reporting system for spills of hazardous substances. For the most part, this system only captured data from the Atlantic Provinces, some from Quebec and Ontario and a portion from British Columbia. Data for Alberta, Saskatchewan, Manitoba and the Territories was not captured. However, NEES is also a repository for previous Environment Canada spill datasets. NEES is composed of the historic datasets ' or Trends ' which dates from approximately 1974 to present. NEES Trends is a compilation of historic databases, which were merged and includes data from NATES (National Analysis of Trends in Emergencies System), ARTS (Atlantic Regional Trends System), and NEES. In 2001, the Emergencies Program determined that variations in reporting regimes and requirements between federal and provincial agencies made national spill reporting and trend analysis difficult to achieve. As a consequence, the department has focused efforts on capturing data on spills of substances which fall under its legislative authority only (CEPA and FA). As such, the NEES database will be decommissioned in December 2004.

Government Publication Date: 1974-2003*

National PCB Inventory: Federal NPCB

Environment Canada's National PCB inventory includes information on in-use PCB containing equipment in Canada including federal, provincial and private facilities. Federal out-of-service PCB containing equipment and PCB waste owned by the federal government or by federally regulated industries such as airlines, railway companies, broadcasting companies, telephone and telecommunications companies, pipeline companies, etc. are also listed. Although it is not Environment Canada's mandate to collect data on non-federal PCB waste, the National PCB inventory includes some information on provincial and private PCB waste and storage sites. Some addresses provided may be Head Office addresses and are not necessarily the location of where the waste is being used or stored.

Government Publication Date: 1988-2008*

National Pollutant Release Inventory 1993-2020: Federal NPR2

The National Pollutant Release Inventory (NPRI) is Canada's public inventory of pollutant releases (to air, water and land), disposals, and transfers for recycling. The inventory, managed by Environment and Climate Change Canada, tracks over 300 substances. Under the authority of the Canadian Environmental Protection Act (CEPA), owners or operators of facilities that meet published reporting requirements are required to report to the NPRI.

Government Publication Date: Sep 2020

National Pollutant Release Inventory - Historic: Federal NPRI

Environment Canada has defined the National Pollutant Release Inventory ("NPRI") as a federal government initiative designed to collect comprehensive national data regarding releases to air, water, or land, and waste transfers for recycling for more than 300 listed substances. This data holds historic records; current records are found in NPR2.

Government Publication Date: 1993-May 2017

Oil and Gas Wells: Private OGWE

The Nickle's Energy Group (publisher of the Daily Oil Bulletin) collects information on drilling activity including operator and well statistics. The well information database includes name, location, class, status and depth. The main Nickle's database is updated on a daily basis, however, this database is updated on a monthly basis. More information is available at www.nickles.com.

Government Publication Date: 1988-May 31, 2024

Ontario Oil and Gas Wells: Provincial OOGW

In 1998, the MNR handed over to the Ontario Oil, Gas and Salt Resources Corporation, the responsibility of maintaining a database of oil and gas wells drilled in Ontario. The OGSR Library has over 20,000+ wells in their database. Information available for all wells in the ERIS database include well owner/operator, location, permit issue date, and well cap date, license No., status, depth and the primary target (rock unit) of the well being drilled. All geology/stratigraphy table information, plus all water table information is also provide for each well record.

Government Publication Date: 1800-Aug 2023

Inventory of PCB Storage Sites: Provincial OPCB

The Ontario Ministry of Environment, Waste Management Branch, maintains an inventory of PCB storage sites within the province. Ontario Regulation 11/82 (Waste Management - PCB) and Regulation 347 (Generator Waste Management) under the Ontario EPA requires the registration of inactive PCB storage equipment and/or disposal sites of PCB waste with the Ontario Ministry of Environment. This database contains information on: 1) waste quantities; 2) major and minor sites storing liquid or solid waste; and 3) a waste storage inventory.

Government Publication Date: 1987-Oct 2004; 2012-Dec 2013

Orders: Provincial ORD

This is a subset taken from Ontario's Environmental Registry (EBR) database. It will include Orders on the registry such as (EPA s. 17) - Order for remedial work, (EPA s. 18) - Order for preventative measures, (EPA s. 43) - Order for removal of waste and restoration of site, (EPA s. 44) - Order for conformity with Act for waste disposal sites, (EPA s. 136) - Order for performance of environmental measures.

Government Publication Date: 1994 - Jun 30, 2024

Canadian Pulp and Paper: Private PAP

This information is part of the Pulp and Paper Canada Directory. The Directory provides a comprehensive listing of the locations of pulp and paper mills and the products that they produce.

Government Publication Date: 1999, 2002, 2004, 2005, 2009-2014

Parks Canada Fuel Storage Tanks: Federal PCFT

Canadian Heritage maintains an inventory of known fuel storage tanks operated by Parks Canada, in both National Parks and at National Historic Sites. The database details information on site name, location, tank install/removal date, capacity, fuel type, facility type, tank design and owner/operator.

Government Publication Date: 1920-Jan 2005*

Pesticide Register: Provincial PES

The Ontario Ministry of the Environment and Climate Change maintains a database of licensed operators and vendors of registered pesticides.

Government Publication Date: Oct 2011-Jun 30, 2024

NPRI Reporters - PFAS Substances: Federal PFCH

The National Pollutant Release Inventory (NPRI) is Canada's public inventory of releases, disposals, and transfers, tracking over 320 pollutants. Per - and polyfluoroalkyl substances (PFAS) are a group of over 4,700 human-made substances for which adverse environmental and health effects have been observed. This listing of PFAS substance reporters includes those NPRI facilities that reported substances that are found in either: a) the Comprehensive Global Database of PFASs compiled by the Organisation for Economic Co-operation and Development (OECD), b) the US Environmental Protection Agency (US EPA) Master List of PFAS Substances, c) the US EPA list of PFAS chemicals without explicit structures, or d) the US EPA list of PFAS structures (encompassing the largest set of structures having sufficient levels of fluorination to potentially impart PFAS-type properties).

Government Publication Date: Sep 2020

Potential PFAS Handlers from NPRI: Federal PFHA

The National Pollutant Release Inventory (NPRI) is Canada's public inventory of releases, disposals, and transfers, tracking over 320 pollutants. Per - and polyfluoroalkyl substances (PFAS) are a group of over 4,700 human-made substances for which adverse environmental and health effects have been observed. This list of potential PFAS handlers includes those NPRI facilities that reported business activity (NAICS code) included in the US Environmental Protection Agency (US EPA) list of Potential PFAS-Handling Industry Sectors, further described as operating in industry sectors where literature reviews indicate that PFAS may be handled and/or released. Inclusion of a facility in this listing does not indicate that PFAS are being manufactured, processed, used, or released by the facility - these are facilities that potentially handle PFAS based on their industrial profile.

Government Publication Date: Sep 2020

Pipeline Incidents: Provincial PINC

List of pipeline incidents (strikes, leaks, spills). This is not a comprehensive or complete inventory of pipeline incidents in the province; this listing in an historical copy of records previously obtained under Access to Public Information. Records are not verified for accuracy or completeness.

Government Publication Date: Feb 28, 2021

Private and Retail Fuel Storage Tanks: Provincial PRT

The Fuels Safety Branch of the Ontario Ministry of Consumer and Commercial Relations maintained a database of all registered private fuel storage tanks and licensed retail fuel outlets. This database includes an inventory of locations that have gasoline, oil, waste oil, natural gas and/or propane storage tanks on their property. The MCCR no longer collects this information. This information is now collected by the Technical Standards and Safety Authority (TSSA).

Government Publication Date: 1989-1996*

Permit to Take Water: Provincial PTTW

This is a subset taken from Ontario's Environmental Registry (EBR) database. It will include PTTW's on the registry such as OWRA s. 34 - Permit to take water.

Government Publication Date: 1994 - Jun 30, 2024

Ontario Regulation 347 Waste Receivers Summary: Provincial REC

Part V of the Ontario Environmental Protection Act ("EPA") regulates the disposal of regulated waste through an operating waste management system or a waste disposal site operated or used pursuant to the terms and conditions of a Certificate of Approval or a Provisional Certificate of Approval. Regulation 347 of the Ontario EPA defines a waste receiving site as any site or facility to which waste is transferred by a waste carrier. A receiver of regulated waste is required to register the waste receiving facility. This database represents registered receivers of regulated wastes, identified by registration number, company name and address, and includes receivers of waste such as: landfills, incinerators, transfer stations, PCB storage sites, sludge farms and water pollution control plants. This information is a summary of all years from 1986 including the most currently available data.

Government Publication Date: 1986-1990, 1992-2021

Record of Site Condition: Provincial RSC

The Record of Site Condition (RSC) is part of the Ministry of the Environment's Brownfields Environmental Site Registry. Protection from environmental cleanup orders for property owners is contingent upon documentation known as a record of site condition (RSC) being filed in the Environmental Site Registry. In order to file an RSC, the property must have been properly assessed and shown to meet the soil, sediment and groundwater standards appropriate for the use (such as residential) proposed to take place on the property. The Record of Site Condition Regulation (O. Reg. 153/04) details requirements related to site assessment and clean up. RSCs filed after July 1, 2011 will also be included as part of the new (O.Reg. 511/09). The Government of Ontario states that it is not responsible for the accuracy of the information in this Registry.

Government Publication Date: 1997-Sept 2001, Oct 2004-Jun 2024

Retail Fuel Storage Tanks: Private RST

This database includes an inventory of retail fuel outlet locations (including marinas) that have on their property gasoline, oil, waste oil, natural gas and / or propane storage tanks.

Government Publication Date: 1999-Apr 30, 2024

Scott's Manufacturing Directory: Private SCT

Scott's Directories is a data bank containing information on over 200,000 manufacturers across Canada. Even though Scott's listings are voluntary, it is the most comprehensive database of Canadian manufacturers available. Information concerning a company's address, plant size, and main products are included in this database.

Government Publication Date: 1992-Mar 2011*

Ontario Spills: Provincial SPL

List of spills and incidents made available by the Ministry of the Environment, Conservation and Parks. This database identifies information such as location (approximate), type and quantity of contaminant, date of spill, environmental impact, cause, nature of impact, etc. Information from 1988-2002 was part of the ORIS (Occurrence Reporting Information System). The SAC (Spills Action Centre) handles all spills reported in Ontario. Regulations for spills in Ontario are part of the MOE's Environmental Protection Act, Part X. The Ministry of the Environment, Conservation and Parks cites the coronavirus pandemic as an explanation for delays in releasing data pursuant to requests. This database includes spill incidents that occurred in Mar 2023-Mar 2024, May 2024 in addition to those listed in the Government Publication Date.

Government Publication Date: 1988-Jan 2023; see description

Wastewater Discharger Registration Database: Provincial SRDS

Facilities that report either municipal treated wastewater effluent or industrial wastewater discharges under the Effluent Monitoring and Effluent Limits (EMEL) and Municipal/Industrial Strategy for Abatement Regulations. The Municipal/Industrial Strategy for Abatement (MISA) division of the Ontario Ministry of Environment keeps record of direct dischargers of toxic pollutants within nine sectors including: Electric Power Generation, Mining, Petroleum Refining, Organic Chemicals, Inorganic Chemicals, Pulp & Paper, Metal Casting, Iron & Steel, and Quarries.

Government Publication Date: 1990-Dec 31, 2021

Anderson's Storage Tanks: Private TANK

The information provided in this database was collected by examining various historical documents, which identified the location of former storage tanks, containing substances such as fuel, water, gas, oil, and other various types of miscellaneous products. Information is available in regard to business operating at tank site, tank location, permit year, permit & installation type, no. of tanks installed & configuration and tank capacity. Data contained within this database pertains only to the city of Toronto and is not warranted to be complete, exhaustive or authoritative. The information was collected for research purposes only.

Government Publication Date: 1915-1953*

Transport Canada Fuel Storage Tanks: Federal TCFT

List of fuel storage tanks currently or previously owned or operated by Transport Canada. This inventory also includes tanks on The Pickering Lands, which refers to 7,530 hectares (18,600 acres) of land in Pickering, Markham, and Uxbridge owned by the Government of Canada since 1972; properties on this land has been leased by the government since 1975, and falls under the Site Management Policy of Transport Canada, but is administered by Public Works and Government Services Canada. This inventory provides information on the site name, location, tank age, capacity and fuel type.

Government Publication Date: 1970 - Apr 2023

Variances for Abandonment of Underground Storage Tanks: Provincial VAR

Listing of variances granted for storage tank abandonment. This is not a comprehensive or complete inventory of tank abandonment variances in the province; this listing is a copy of tank abandonment variance records previously obtained under Access to Public Information. In Ontario, registered underground storage tanks must be removed within two years of disuse; if removal of a tank is not feasible, an application may be sought for a variance from this code requirement.
Records are not verified for accuracy or completeness.

Government Publication Date: Feb 28, 2022

Waste Disposal Sites - MOE CA Inventory: Provincial WDS

The Ontario Ministry of Environment, Waste Management Branch, maintains an inventory of known open (active or inactive) and closed disposal sites in the Province of Ontario. Active sites maintain a Certificate of Approval, are approved to receive and are receiving waste. Inactive sites maintain Certificate(s) of Approval but are not receiving waste. Closed sites are not receiving waste. The data contained within this database was compiled from the MOE's Certificate of Approval database. Locations of these sites may be cross-referenced to the Anderson database described under ERIS's Private Source Database section, by the CA number. All new Environmental Compliance Approvals handed out after Oct 31, 2011 for Waste Disposal Sites will still be found in this database.

Government Publication Date: Oct 2011-Jun 30, 2024

Waste Disposal Sites - MOE 1991 Historical Approval Inventory: Provincial WDSH

In June 1991, the Ontario Ministry of Environment, Waste Management Branch, published the "June 1991 Waste Disposal Site Inventory", of all known active and closed waste disposal sites as of October 30st, 1990. For each "active" site as of October 31st 1990, information is provided on site location, site/CA number, waste type, site status and site classification. For each "closed" site as of October 31st 1990, information is provided on site location, site/CA number, closure date and site classification. Locations of these sites may be cross-referenced to the Anderson database described under ERIS's Private Source Database section, by the CA number.

Government Publication Date: Up to Oct 1990*

Water Well Information System: Provincial WWIS

This database describes locations and characteristics of water wells found within Ontario in accordance with Regulation 903. It includes such information as coordinates, construction date, well depth, primary and secondary use, pump rate, static water level, well status, etc. Also included are detailed stratigraphy information, approximate depth to bedrock and the approximate depth to the water table.

Government Publication Date: Dec 31 2023

Definitions

Database Descriptions: This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

Detail Report: This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

Inspection Report Summary (Included in Final Report)

On August 11th, 2009, at 13:00. an inspection was conducted at the Nelson Aggregate Company in the Halton Hills. The site is a medium sized quarry consisting of aggregate of stone. The Company has a permit to take water # 96-P-3009 issued in April of 1996. There is no expiry date on the permit. The permit is issued for the de-watering of the quarry. During the inspection, Randy Warren, Safety and Environment Manager, accompanied me and provided me with information. There are two pumps used for the dewatering process and both are submersible pumps. Both pump houses are equipped with flow sensors, electronic flow meters and data loggers. At the time of inspection, observations revealed that Pump #1 had the meter missing from the monitoring line. Water quality from both discharge points were visibly clear. Ground water wells were installed on site to monitor ground water levels. One well was not secure. Waste oil is generated at the site from vehicle oil changes. A manifest review indicated minor non-compliance with O. Reg 347. Waste oil is being stored for more than 90 days. The shop interceptor containment integrity is unknown. The drilled well on site is for domestic use.

Field Inspection Observations

Checklist Name: Unnamed Checklist

Act/Reg: EPA|Reg347|17.2(5)(ii) **Non-Compliance Yes**

Act/Reg Wording: *17.2(5)(ii) If a waste generation facility to which subsection 17.1 (1) applies stores subject waste, the operator and the owner of the facility shall ensure that it is operated in accordance with the following rules:*

(5) If subject waste is stored at the waste generation facility for more than 90 days, a record must be made of the following information within five business days after the 90th day of storage:

ii. The quantity of the waste.

Comments/Findings: At the time of inspection, observations revealed that waste oil 252L was kept on site for more than 90 days.

Act/Reg: EPA|Reg347|23(2)(b)(ii) **Non-Compliance Yes**

Act/Reg Wording: *23(2)(b)(ii) Where subject waste is transferred to a waste transportation system by a generator and a paper manifest is used,*

(b) for each truckload or part thereof transferred, the generator shall obtain from the carrier the intact manifest, with section B completed, and shall,

(ii) remove Copy 1 (White) and return it to the Director within three working days after the transfer

Comments/Findings: At the time of inspection, observations revealed that Manifest #'s BN44219-5 and RE30366-5 had a White Copy (copy 1) retained at the premises.

Act/Reg: OWRA|Reg387/04|9(1) **Non-Compliance Yes**

Act/Reg Wording: *9(1) Every person to whom a permit has been issued under section 34 of the Act shall collect and record data on the volume of water taken daily.*

Comments/Findings: At the time of inspection, observations revealed that a metering valve on Quarry Pump #1 was missing and being repaired. Water volume uptake cannot be monitored accurately without the meter.

Act/Reg: OWRA|Reg903|21.1(1)8 ii **Non-Compliance Yes**

Act/Reg Wording: *21.1(1)8 ii If a well is abandoned, the person abandoning the well shall ensure that the following steps are taken and, unless otherwise specified, they shall be taken in the sequence in which they are set out in this subsection:*

8. The well shall be sealed at the ground surface by,

ii. fill the remaining well opening to the ground surface with soil cover, or other material that is more in keeping with the surface material immediately adjacent to the well opening, to prevent inadvertent or unauthorized access.

Comments/Findings: At the time of inspection, observations revealed that a ground water monitoring well was not locked to prevent access by un-authorized persons.

Field Inspection Observations

Act/Reg:	**EPA|Act|157.1(1)(a)**	**Non-Compliance No**
Act/Reg Wording:	*A provincial officer may issue an order to any person who owns or who has management or control of an undertaking or property if the provincial officer reasonably believes that the requirements specified in the order are necessary or advisable so as,* *(a) to prevent or reduce the risk of a discharge of a contaminant into the natural environment from the undertaking or property;*	
Comments/Findings:	At the time of inspection, observations revealed that an interceptor used in the maintenance shop had no integrity testing and was full of waste material.	

Act/Reg:	**OWRA|Reg387/04|9(8)(3)**	**Non-Compliance No**
Act/Reg Wording:	*9(8)(3) Paragraph 3 of subsection (5) applies to every person to whom a permit has been issued under section 34 of the Act for taking water for any of the following purposes:* *3. Any purpose not described in subsection (6) or (7).*	
Comments/Findings:	The permit has been issued for de-watering purposes.	

Observation:	Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material?	
Observation Type:	Other	Response: No
Comments/Findings:	There was no indication of a health or environmental impact after review of relevant material.	

Observation:	Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment?	
Observation Type:	Other	Response: No
Comments/Findings:	There was no indication of a know or suspected violation of a legal requirement during the inspection and after review of relevant material that could cause a health or environmental impact.	

Observation:	Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?	
Observation Type:	Other	Response: No
Comments/Findings:	There was no indication of a health or environmental impact during the inspection.	

Observation:	Was there any indication of a potential for a human health impact or environmental impairment during the inspection and/or the review of relevant material?	
Observation Type:	Other	Response: No
Comments/Findings:	There was no indication for the potential for a human health impact or environmental impairment during the inspection or review of relevant material.	

Recommended Actions

Conditions of Permit to Take Water (PTTW) # 96-P-3009 were generally met. However, I am requesting that you repair the metering unit for the Northwest sump so that the monitoring process for water uptake can resume. Please ensure meter is repaired by September 30th, 2009 and inform me, in writing, when it is installed and working.

In addition to the above, there were other non-compliance items to O. Reg. 347 and the OWRA as listed in the inspection report observations;

a.) Please ensure that the interceptor in the maintenance shop is pumped and checked for integrity OR sealed.

b.) Ensure that a 90 day storage report is filed with the Halton/Peel Office for waste storage for more than 90 days OR remove then waste via certified carrier within the 90 period.

c.) Please ensure that all ground water monitoring wells on-site are secure from access by un-authorized persons.

d.) Please review the O. Reg 347 manifest preparation and filing procedures to avoid violations in the future.

I am requesting that all items listed above are to be completed by September 30th, 2009. Once completed, please inform me in writing.

This Inspection Report does not in any way suggest that there is or has been compliance with all applicable legislation and regulations as they may apply to this facility. It is, and remains, the responsibility of the owner and/or the operating authority to ensure compliance with all applicable legislative and regulatory requirements.

Incident Information

Incident Summary: SCB Pro-Active PTTW Inspection
cannot be longer than 60 characters

Incident Description: On August 11th, 2009, at 13:00. an inspection was conducted at the Nelson Aggregate Company in the Halton Hills. The site is a medium sized quarry consisting of aggregate of stone. The Company has a permit to take water # 96-P-3009 issued in April of 1996. There is no expiry date on the permit. The permit is issued for the de-watering of the quarry. During the inspection, Randy Warren, Safety and Environment Manager, accompanied me and provided me with information. There are two pumps used for the dewatering process and both are submersible pumps. Both pump houses are equipped with flow sensors, electronic flow meters and data loggers. At the time of inspection, observations revealed that Pump #1 had the meter missing from the monitoring line. Water quality from both discharge points ware visibly clear. Ground water wells ware installed on site to monitor ground water levels. One well was not secure. Waste oil is generated at the site from vehicle oil changes. A manifest review indicated minor non-compliance with O. Reg 347. Waste oil is being stored for more than 90 days. The shop interceptor containment integrity is unknown. The drilled well on site is for domestic use.

August 12, 2009 - Inspection Completed
August 19, 2009 - Letter SCB-762-028-09 Served
September 22, 2009 Email From Company - partial Compliance confirmed

Offence(s)

Suspected Violation(s)/Offence(s):

Act - Regulation - Section,
Description
{General Offence}
1) EPA - Reg. 347 - 17.2 5.,
if subject waste is stored at the waste generation facility for more than 90 days, a record must be made of the following information within five business days after the 90th day of storage: i. The name and waste number of the waste. ii. The quantity of the waste. iii. The manner in which the waste is stored. iv. The reasons for storing the waste. v. The anticipated time and manner of disposal of the waste.
{186(1)}

2) EPA - Reg. 347 - 23 (2)(b)(ii),
Where subject waste is transferred to a waste transportation system by a generator and a paper manifest is used, for each truckload or part thereof transferred, the generator shall remove Copy 1 (White) and return it to the Director within three working days after the transfer.
{186(1)}

3) OWRA - Reg. 387/04 - 9 (1),
Every person to whom a permit has been issued under section 34 of the Act shall collect and record data on the volume of water taken daily.
{107 (1)}

Re: Inspection Report #1-AP07B
Recommended Actions

a. Floor interceptor in the garage has been pumped and sealed.
   (i) NOCO pumped out pit on September 2, 2009.

b. Arrangements have been made with NOCO (our waste hauler) to remove waste oil every 90 days.

c. The two ground water monitoring wells have been secured, thus ensuring no un-authorized access.

d. Manifesting procedures as per O. Reg 347 have been developed and communicated to the appropriate staff and are now in place.

Yours truly

R. E. Warren

August 19th, 2009

Dear Randy Warren;

This letter is in regards to the inspection conducted on August 11th, 2009. Attached to this letter is an inspection report which contains observations gathered at the time of inspection. The purpose of this inspection was to access the state of compliance with the EPA and OWRA at your site.

Conditions of Permit to Take Water (PTTW) # 96-P-3009 were generally met. However, I am requesting that you repair the metering unit for the Northwest sump so that the monitoring process for water uptake can resume. Please ensure meter is repaired by September 30th, 2009 and inform me, in writing, when it is installed and working.

In addition to the above, there were other non-compliance items to O. Reg. 347 and the OWRA as listed in the inspection report observations;

a.) Please ensure that the interceptor in the maintenance shop is pumped and checked for integrity OR sealed.

b.) Ensure that a 90 day storage report is filed with the Halton/Peel Office for waste storage for more than 90 days OR remove then waste via certified carrier within the 90 period.

c.) Please ensure that all ground water monitoring wells on-site are secure from access by un-authorized persons.

d.) Please review the O. Reg 347 manifest preparation and filing procedures to avoid violations in the future.

I am requesting that all items listed above are to be completed by September 30th, 2009. Once completed, please inform me in writing.

If you have any questions regarding the inspection report, please contact me and I will gladly assist you. Your co-operation and assistance with this inspection was much appreciated.

Regards;

...accused, also...
...of the community or protect national security.

Here are a few suggested replies that indicate why you can't answer a media question, while still avoiding the "*no comment*" reply:

1. It's under investigation.
2. That's an area we would rather not talk about right now.
3. When the investigation is complete, we'd be glad to share the details with you.
4. The judge has issued a publication ban on the case which prevents me from speaking about matters before the court. A number of issues surrounding this case will be dealt with in the courtroom over the course of the inquiry/case/trial. We will be stating our position at that time.

NOTE: *These are Triform suggested guidelines only. You must follow the authorized instructions of your service and superior officers.*

RE: PERMIT TO TAKE WATER FOR: DEWATERING PURPOSES
BURLINGTON QUARRY
LOT 2, CONCESSIONS 2 AND 3
CITY OF BURLINGTON, REGIONAL MUNICIPALITY OF HALTON
PERMIT TO TAKE WATER NO. 96-P-3009
FILE: SI-HP-BU-220

Please find attached Permit No. 96-P-3009 issued to Nelson Aggregate Co. which authorizes the withdrawal of water in accordance with the application for this Permit to Take Water, and Schedule "A" and Schedule "B" which are attached to and form part of this Permit.

This Permit is valid indefinitely and shall be kept available for inspection by Ontario Ministry of Environment staff.

Take notice that in issuing this Permit to Take Water, terms and conditions pertaining to the taking of water and to the results of the taking have been imposed on Nelson Aggregate Co.. The terms and conditions have been designed to allow for the development of water resources for beneficial purposes, while providing reasonable protection to existing water uses and users.

Our main concern is that the taking of water under the authority of this Permit does not cause negative impacts to other water supplies which were in use prior to the date of this Permit. If the taking of water should result in any negative impacts, the permittee will be required to restore the water supplies of those affected in a manner acceptable to the Ontario Ministry of Environment and Energy or to reduce the rate and amount of taking until any negative impacts are eliminated.

Any change of address or ownership of the property for which this Permit is issued must be reported promptly to the Director.

cont'd

The issuance of this Permit To Take Water does not relieve you from compliance with this or any other agencies' legislative requirements.

It is the responsibility of Nelson Aggregate Co. to ensure that any person taking water under the authority of this Permit is familiar with and complies with the terms and conditions.

Yours Truly,

S. Klose

GENERAL CONDITIONS

2. This Permit shall be kept available for inspection by Ministry staff.

3. The Director may, from time to time, where a situation of interference or anticipated interference with water supply exists, or in a situation requiring information on water takings for purposes of water resource inventory and planning, give written notice to the Permit Holder to undertake any of the following actions. The Permit Holder shall comply with any such notice:

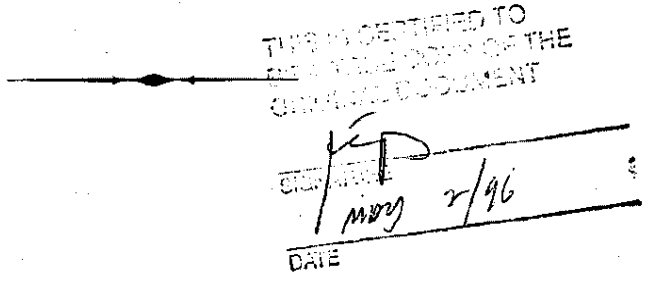
   (a) To establish and maintain a system for the measurement of the quantities of water taken;

   (b) To operate such a system and to record measurements of the quantities of water taken on forms provided by the District Manager or the Director, with such a frequency or for such periods of time as the District Manager or the Director may specify;

   (c) To return to the District Manager or the Director records made pursuant to clause 3(b) at such times or with such frequency as the District Manager or the Director may specify; and

   (d) To keep records made pursuant to clause 3(b) available for inspection by Ministry staff until such time as they are returned to the District Manager or the Director pursuant to clause 3(c).

4. The Permit Holder shall immediately notify the District Manager of any complaint arising from the taking of water authorized under this Permit and shall report any action which has been taken or is proposed with regard to such complaint.



5. For Groundwater Takings, if the taking of water is forecast to cause any negative impact, or is observed to cause any negative impact to other water supplies obtained from any adequate sources that were in use prior to the initial issuance of a permit for this water taking, the Permit Holder shall take such action necessary to make available to those affected a supply of water equivalent in quantity and quality to their normal takings, or shall compensate such persons for their reasonable costs of so doing, or shall reduce the rate and amount of taking to prevent the forecasted negative impact or alleviate the observed negative impact. Pending permanent restoration of the affected supplies, the Permit Holder shall provide, to those affected, temporary water supplies adequate to meet their normal requirements, or shall compensate such persons for their reasonable cost of so doing.

6. The Permit Holder shall report to the Director any changes of address or telephone number, or change of ownership of the property for which this Permit is issued within thirty days of any such change. The Permit Holder shall not assign his rights under this Permit to another person without the written consent of the Director.

7. This Permit does not release the Permit Holder from any legal liability or obligation and remains in force subject to all limitations, requirements and liabilities imposed by law. This Permit shall not be construed as precluding or limiting any legal claims or rights of action that any person, including the Crown in right of Ontario or any agency thereof, has or may have against the Permit Holder, its officer, employees, agents, and contractors.

8. The Permit Holder must forthwith, upon presentation of credentials, allow Ministry personnel, or a Ministry authorized representative(s) to carry out any and all inspections authorized by Section 15, 16 or 17 of the Ontario Water Resources Act, R.S.O. 1990, Section 156, 157 or 158 of the Environmental Protection Act, R.S.O. 1990 or Section 19 or 20 of the Pesticides Act, R.S.O. 1990.

Burlington City, Regional Municipality of Halton
MOE Reference Number 3110-78GQKP

This is to advise you that, further to our discussions with your engineering consultant, the application is considered withdrawn and the above-noted file is now closed.

The submitted application fee will be refunded shortly in the amount of $2,000 which represents the amount submitted reduced by the non-refundable administrative processing fee of $200.

If you wish to pursue your original proposal in the future, you will need to submit a new application complete with all required supporting information and appropriate application fee.

We also emphasize that under section 53 of the Ontario Water Resources Act, R.S.O. 1990, you are required to obtain an approval under the same section 53 of the Act before construction, alteration, extension or replacement of any sewage works.

Application for Approval of Industrial Sewage Works

For Office Use Only			
Reference Number	Payment Received	Date *(y/m/d)*	Initials
	$		

General Information and Instructions

General:

Information requested in this form is collected under the authority of the *Ontario Water Resources Act*, R.S.O. 1990 (OWRA) and the *Environmental Bill of Rights*, C. 28, Statues of Ontario, 1993, (EBR) and will be used to evaluate applications for approval of industrial sewage works under Section 53 OWRA.

Instructions:

1. When completing this form, please refer to the "Guide for Applying for Approval of Industrial Sewage Works, Section 53, OWRA " (referred to as the Guide) and "Guide - Application Cost for Sewage works, S. 53, OWRA." Questions regarding completion and submission of the application should be directed to the Environmental Assessment & Approvals Branch, 2 St. Clair Avenue West, Floor 12A, Toronto, Ontario, M4V 1L5, telephone number 1-800-461-6290 or (416) 314-8001, or to your local District Office of the Ministry of the Environment.

2. This form must be completed with respect to all the requirements of the Guide in order for it to be considered as an application for approval. INCOMPLETE APPLICATIONS WILL BE RETURNED TO THE APPLICANT.

3. A complete application consists of:
   (1) a completed and signed application form, including the attached "Costs for OWRA S. 53 Application - Supplement to Application for Approval";
   (2) all supporting information as requested by this form and by the Guide, and
   (3) a certified cheque or money order, in Canadian funds, made payable to the *Minister of Finance* for the applicable application fee.
   The Ministry may require additional information during the technical review of any application accepted as complete.

4. The original application, along with the supporting information and the application fee, must be sent to:
   The Ministry of the Environment,
   Director, Environmental Assessment and Approvals Branch,
   2 St Clair Avenue West, Floor 12A, Toronto, Ontario M4V 1L5.
   A copy of the application and the supporting information must be sent to the local Ministry District Office which has jurisdiction over the area where the facilities are located.

5. Information contained in this application is not considered confidential and will be made available to the public upon request. Information submitted as supporting information may be claimed as confidential but will be subject to the *Freedom of Information and Protection of Privacy Act* (FOIPPA) and *EBR*. If you do not claim confidentiality at the time of submitting the information, the Ministry may make the information available to the public without further notice to you.

6. If the Client submits with the application a copy of their Master Business Licence (MBL) obtained from the Ministry of Consumer and Commercial Relations, the **shaded sections within this form do not need to be completed**. For additional information on the MBL please refer to the "Guide."

1. Client Information

Client Name *(legal name of individual or organization as evidenced by legal documents)*	Business Identification Number
Nelson Aggregate Co.	

Business Name *(the name under which the entity is operating or trading if different from the Client Name - also referred to as trade name)*

Client Type:

- ☐ Corporation
- ☐ Individual
- ☑ Partnership
- ☐ Sole Proprietor
- ☐ Federal Government
- ☐ Municipal Government
- ☐ Provincial Government
- ☐ Other *(describe)*:

Activity Classification Code/Standard Industrial Classification Code *(if unknown please complete Business Activity Description)*: NAICS 212315

Business Activity Description *(a narrative description of the business endeavour, this may include products sold, services provided or machinery/equipment used, etc.)*

Aggregate production

Is the client a MISA Discharger?	If Yes, name the industrial sector:
☐ Yes ☑ No	

2. Client Physical Address - *Complete A, C and D* **or** *B, C and D*

A. Civic Address - Street information *(applies to an address that has civic numbering and street information - includes street number, name, type and direction)*	Unit Identifier *(identifies type of unit, such as suite & number)*
No. 2 Side Road	

B. Survey Address *(used for a rural location specified for a subdivided township, an unsubdivided township or unsurveyed territory)*

Lot and Conc.: used to indicate location within a subdivided township and consists of a lot number and a concession number.	Lot	Conc.	Part and Reference: used to indicate location within an unsubdivided township or unsurveyed territory, and consists of a part and a reference plan number indicating the location within that plan. Attach copy of the plan	Part	Reference Plan

C. Municipality/Unorganized Township	County/District	Province/State	Country	Postal Code
Burlington		Ontario	Canada	L7R 3X4

D. Telephone Number *(including area code & extension)*	Fax Number *(including area code)*	E-mail Address
905-335-5250	905-336-5697	

3. Client Mailing Address - *Complete A and C* **or** *B and C*

A. Civic Address - Street information *(includes street number, name, type and direction)*	☐ Same as Client Physical Address	Unit Identifier *(identifies type of unit, such as suite & number)*
P. O. Box 1070		

Delivery Designator: ☐ Rural Route ☐ Suburban Service ☐ Mobile Route ☐ General Delivery — Delivery Identifier *(a number identifying a Rural Route, Suburban Service or Mobile Route delivery mode)*

C. Municipality	Postal Station	Province/State	Country	Postal Code
Burlington		Ontario	Canada	L7R 4I8

4. Site Information - *(location where activity/works applied for is to take place)*

Site Name	MDE District Office	Legal Description *(attach copy of a legal survey)*
Burlington Quarry	Halton - Peel	

A. Site Address - Street information *(applies to an address that has civic numbering and street information - includes street number, name, type and direction)*	☑ Same as Client Physical Address	Unit Identifier *(identifies type of unit, such as suite & number)*

B. Survey Address *(used for a rural location specified for a subdivided township, an unsubdivided township or unsurveyed territory)* *NOTE:* Do not complete "B" if you completed "A."

Lot and Conc.: used to indicate location within a subdivided township and consists of a lot number and a concession number.	Lot	Conc.	Part and Reference: used to indicate location within an unsubdivided township or unsurveyed territory, and consists of a part and a reference plan number indicating the location within that plan. Attach copy of the plan.	Part	Reference Plan
	1	3			

Non Address Information *(includes any additional information to clarify clients' physical location)*

Geo Reference Map Datum	Zone	Accuracy Estimate	Geo Referencing Method	UTM Easting	UTM Northing

Municipality/Unorganized Township	County/District	Postal Code
Burlington	Canada	L7R 3X4

Adjacent Land Use

☐ Industrial ☐ Commercial ☑ Recreational
☑ Residential ☑ Agricultural ☐ Other *(specify)*:

Is the Site located in an area of development control as defined by the Niagara Escarpment Planning & Development Act (NEPDA)?

☑ Yes (*If Yes, attach copy of NEPDA permit for the proposed activity/work*) N/A ☐ No

Is the Client the operating authority? ☑ Yes ☐ No

If No, attach the operating authority name, address and phone number.

Is the Client the owner of the land (site)? ☑ Yes ☐ No

If No, attach the owner's name, address and consent for the installation and operation of the facilities.

Is the Site located on the Oak Ridges Moraine Conservation Area as defined by the Oak Ridges Moraine Conservation Plan (ORMCP, a regulation made under the Oak Ridges Moraine Conservation Act (ORMCA)?

☐ Yes **(If yes please attach proof of Municipal planning approval for the proposed activity/work)**

☑ No

5. Project Technical Information Contact - *Complete A, B, D and E* **or** *A, C, D, and E*

A. Name	Company	☐ Same as Client Name
Stephen Di Biase	Golder Associates Ltd.	

Contact Address B. Civic Address - Street information *(includes street number, name, type and direction)*	☐ Same as Client Mailing Address	Unit Identifier *(identifies type of unit, such as suite & number)*
2390 Argentia Road		

C. Delivery Designator: ☐ Rural Route ☐ Suburban Service ☐ Mobile Route ☐ General Delivery	Delivery Identifier *(a number identifying a Rural Route, Suburban Service or Mobile Route delivery mode)*

D. Municipality	Postal Station	Province/State	Country	Postal Code
Mississauga		Ontario	Canada	L5N 5Z7

E. Telephone Number *(including area code & extension)*	Fax Number *(including area code)*	E-mail Address

6. Project Information

Type of Application:	Current Certificate of Approval Number	Date of Issue *(y/m/d)*
☑ New Certificate of Approval ☐ Amendment to current Certificate of Approval		

oject Description Summary *(If EBR is applicable, this summary will be used in the EBR posting notice)*

An approval under Section 53 of the Ontario Water Resources Act is required as it relates to the discharge of quarry sump water to ground water injection wells.

Project Name *(Project identifier to be used as a reference in correspondence)*	Receiver of Effluent Discharge	Watershed Name
Nelson Burlington Quarry	Water Table	Grindstone

Project Schedule

Estimated date for start of construction/installation	Estimated date for start of operation
N/A	November 5, 2007

.. Other Approvals / Permits

List all other environmental approvals/permits applied for related to this project or received in relation to this project under the *Environmental Protection Act* (discharges to air, waste management, etc.) and the *Ontario Water Resources Act* (water works).

Permit to take water 96-P-3009

8. Public Consultation/Notification

Specify all public consultation/notification *(such as public hearings, notification of First Nations, etc.)* related to the project that has been completed or is in the process of being completed.

9. Environmental Bill of Rights Requirements

Is this a proposal for a Prescribed instrument under EBR?	If "Yes," is it excepted from public participation?	If it is excepted from public participation provide reason:	
☐ Yes ☑ No	☐ Yes ☐ No	☐ Equivalent Public Participation	☐ Environmentally Insignificant Amendment or Revocation
		☐ Emergency	☐ EAA or Tribunal Decision

Documentation is support of the above noted exception must be provided (refer to "Guide")

10. Supporting Information Checklist - *This is a list of all supporting information to this application and is subject to the FOIPPA and EBR*

Supporting Information	Attached	Reference	Can be disclosed
General			
Pre-application consultation record	☑ Yes ☐ No	Cover letter	☐ Yes ☐ No
Proof of Legal Name of Client	☑ Yes ☐ No	Attachment F	☐ Yes ☐ No
Copy of NEPDA Permit	☐ Yes ☑ No	Not applicable	☐ Yes ☐ No

Administrative processing	$ 200	✓
Wastewater Treatment and Disposal (Table 1)	$	☐
Wastewater Disposal (Table 2)	$ 2,000	☑
Review (Table 3)	$	☐
Hearing (if required)	$ 18,000	☐
TOTAL COST:	$ 2,200.00	

Table 1: ***Wastewater Treatment and Disposal***

When completing this table, please note the following:

Category 1 Amendment:
The application relates to an amendment to an existing treatment plant approval to include additional facilities to increase the approved rated capacity of the plant, including the expansion, re-rating, or upgrading of an existing facility.

Category 2 Amendment:
The application relates to an amendment to an existing treatment plant approval to include additional facilities that do not increase the approved rated capacity of the plant, including new tertiary treatment facilities, plant process waste stream treatment and disposal facilities, new treatment facilities to replace deteriorated facilities and the establishment, alteration, expansion or replacement of an outfall.

Category 3 Amendment:
If the application relates to the alteration, extension or replacement of treatment plant equipment or processes that do not involve the addition of new facilities, including:

A. the alteration, extension or replacement of a pumping system, an aeration system, a chemical storage or application system, filter media or a standby power supply system,
B. the provision of additional points of process chemical application, and
C. the provision of odour control equipment facilities.

Category 4 Amendment:
Any other case of amendment requiring technical review.

Description	Maximum Design Capacity	Application Type	Amendment Category	Cost	(✓)

Dear Mr. Goodchild:

RE: PERMIT TO TAKE WATER FOR: PUMP TEST
NELSON AGGREGATE - BURLINGTON QUARRY
LOTS 17 & 18, CONCESSION 2 NDS
CITY OF BURLINGTON, REGIONAL MUNICIPALITY OF HALTON

PERMIT TO TAKE WATER NO. 03-P-3073PT
FILE: SI-HP-BU-220

Please find attached Permit No. **03-P-3073PT** issued to Nelson Aggregate c/o Golder Associates Ltd. which authorizes the withdrawal of water in accordance with the application for this Permit to Take Water, and Schedule "A" and Schedule "B" which are attached to and form part of this Permit.

This Permit is valid until **June 30, 2004** and shall be kept available for inspection by Ontario Ministry of the Environment staff. The expiry should allow some flexibility in the scheduling of the test.

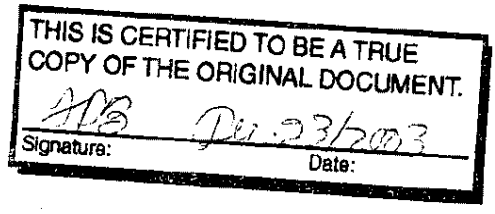
Although this Permit is for a short term preliminary pump test on lands presently owned by Nelson Aggregate, we are concerned about the long term potential impact the proposed expanded quarrying activities on these lands may have on the ground and surface waters supplies in this area. It is therefore critical to establish and document existing conditions on these lands in the early stages of the planning process and if you have not already done so, we strongly recommend that you consider the implementation of a complete ground and surface water monitoring program as soon as possible.

The groundwater program should include the installation of continuous water level recorders to establish existing trends across the site. While manual measurements in various monitor wells on a regular basis are helpful, they tend to miss rapid changes or anomalies specific to certain areas

Take notice that in issuing this Permit to Take Water, terms and conditions pertaining to the taking of water and to the results of the taking have been imposed on Nelson Aggregate and Golder Associates

Ltd. The terms and conditions have been designed to allow for the development of water resources for beneficial purposes, while providing reasonable protection to existing water uses and users.

One of the purposes of the issuance of a Permit is to ensure that the permitted taking(s) will not cause negative impacts to the environment or other water supplies which were in use prior to the date of this Permit. If the taking of water should result in any negative impacts, the Permit Holder will be required to restore the water supplies of those affected in a manner acceptable to the Ontario Ministry of the Environment or to reduce the rate and amount of taking until any negative impacts are eliminated.



Any change of address or ownership of the property for which this Permit is issued must be reported immediately to the Director.

The issuance of this Permit To Take Water does not relieve you from compliance with the legislative requirements of this Ministry or any other agencies.

It is the responsibility of Nelson Aggregate and Golder Associates Ltd. to ensure that any person taking water under the authority of this Permit is familiar with and complies with the terms and conditions.

Yours truly,

Ellen Schmarje
Director, Section 34
Ontario Water Resources Act

Notice of Terms and Conditions
Section 100, Ontario Water Resources Act, R.S.O. 1990

Pursuant to Section 34 of the Ontario Water Resources Act, R.S.O. 1990 permission is hereby granted to:

Nelson Aggregate
c/o Golder Associates Ltd.
P.O. Box 1070
Station B
Burlington, Ontario
L7P 3S9

for the taking of water for a **pump test** in accordance with the application for this Permit to Take Water, and Schedule "A" and Schedule "B", which are attached to and form part of this Permit.

Located at: **Part Lots 17-18,**
Concession 2 NDS
City of Burlington
Regional Municipality of Halton

DEFINITIONS

1. (a) "Director " means a Director, Section 34, Ontario Water Resources Act, R.S.O. 1990.

(b) "District Office" means Halton Peel District Office, Central Region, Ontario Ministry of the Environment.

(c) "District Manager" means District Manager, Halton Peel District Office, Central Region, Ontario Ministry of the Environment.

(d) "Ministry" means Ontario Ministry of the Environment.

(e) "Permit" means this entire Permit to Take Water including its Schedules, if any, issued in accordance with Section 34 of the Ontario Water Resources Act, R.S.O. 1990.

(f) "Permit Holder" means **Nelson Aggregate & Golder Associates Ltd.**

THIS IS CERTIFIED TO BE A TRUE COPY OF THE ORIGINAL DOCUMENT.
Signature: Date: Dec 23/2003

GENERAL CONDITIONS

2. This Permit shall be kept available for inspection by Ministry staff.

3. The Director may, from time to time, where a situation of interference or anticipated interference with water supply exists, or in a situation requiring information on water takings for purposes of water resource inventory and planning, give written notice to the Permit Holder to undertake any of the following actions. The Permit Holder shall comply with any such notice:

   (a) To establish and maintain a system for the measurement of the quantities of water taken;

   (b) To operate such a system and to record measurements of the quantities of water taken on forms provided by the District Manager or the Director, with such a frequency or for such periods of time as the District Manager or the Director may specify;

   (c) To return to the District Manager or the Director records made pursuant to clause 3(b) at such times or with such frequency as the District Manager or the Director may specify;

   (d) To keep records made pursuant to clause 3(b) available for inspection by Ministry staff until such time as they are returned to the District Manager or the Director pursuant to clause 3(c).

4. The Director may, during times of drought or water shortage in the locality of the taking, give notice to the Permit Holder to suspend or reduce the taking to an amount or threshold specified by the Director. The suspension or reduction in taking shall be effective immediately and may be revoked at any time upon notification by the Director. This condition does not affect your right to appeal the notice to the Environmental Appeal Board under the Ontario Water Resources Act, Section 100 (3).

5. The Permit Holder shall immediately notify the District Manager of any complaint arising from the taking of water authorized under this Permit and shall report any action which has been taken or is proposed with regard to such complaint.

6. For Surface Water Takings, the taking of water (including the taking of water into storage and the subsequent or simultaneous withdrawal from storage) shall be carried out in such a manner that streamflow is not stopped and is not reduced to a rate that will cause interference with downstream uses of water or with the natural functions of the stream.

7. For Groundwater Takings, if the taking of water is forecast to cause any negative impact, or is observed to cause any negative impact to other water supplies obtained from any adequate sources that were in use prior to the initial issuance of a permit for this water taking, the Permit Holder shall take such action necessary to make available to those affected a supply of water

equivalent in quantity and quality to their normal takings, or shall compensate such persons for their reasonable costs of so doing, or shall reduce the rate and amount of taking to prevent the forecasted negative impact or alleviate the observed negative impact. Pending permanent restoration of the affected supplies, the Permit Holder shall provide, to those affected, temporary water supplies adequate to meet their normal requirements, or shall compensate such persons for their reasonable cost of so doing.

8. The Permit Holder shall report to the Director any changes of address or telephone number, or change of ownership of the property for which this Permit is issued within thirty days of any such change. The Permit Holder shall not assign his rights under this Permit to another person without the written consent of the Director.

9. No water may be taken under authority of this Permit after the expiry date of this Permit, unless the Permit is renewed, or after the expiry date shown on any subsequent renewal of this Permit, unless is likewise renewed.

10. This Permit does not release the Permit Holder from any legal liability or obligation and remains in force subject to all limitations, requirements and liabilities imposed by law. This Permit shall not be construed as precluding or limiting any legal claims or rights of action that any person, including the Crown in right of Ontario or any agency thereof, has or may have against the Permit Holder, its officer, employees, agents, and contractors.

11. This Permit does not abrogate the Permit Holder's responsibility to comply with all applicable legislation, including O. Reg. 285/99, which provides, among other things, that no person shall use water by transferring it out of a water basin (as defined in the Regulation) in a container having a volume greater than 20 Litres. The Regulation divides Ontario into three water basins, being the Great Lakes - St. Lawrence, the Nelson, and Hudson Bay Basins.

12. The Permit Holder must forthwith, upon presentation of credentials, allow Ministry personnel, or a Ministry authorized representative(s) to carry out any and all inspections authorized by Section 15, 16 or 17 of the Ontario Water Resources Act, R.S.O. 1990, Section 156, 157 or 158 of the Environmental Protection Act, R.S.O. 1990 or Section 19 or 20 of the Pesticides Act, R.S.O. 1990.

SPECIAL CONDITIONS

13. This Permit expires on **June 30, 2004.**

14. The monitoring program for all on site and off site ground and surface water sites referenced in the Golder Associates Ltd. October 30, 2003 report accompanying the Permit application shall be implemented at least 2 days prior to the test and continued for a period not less than 3 days after the termination of all pumping activity.

15. All property owners within 250 m of the boundary of the subject property shall be notified of the proposed pump test prior to the event and provided with a 24-hour contact number. Any complaints received shall be investigated promptly and a temporary water supply provided to the affected party when required. A report detailing all complaints received and the action taken by the Permitee must be submitted to the Director with 30 days of the completion of the pump test.

16. Should the drawdown in the various monitor wells at or beyond a 500 m radius of PW 1 approach 1 m during the pumping activity, the entire test results must be evaluated immediately and the pumping activity terminated if the data indicates serious interference with neighbouring domestic wells may occur.

In accordance with Section 100 of the Ontario Water Resources Act, R.S. O. 1990, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Environmental Review Tribunal. Section 101 of the Ontario Water Resources Act, R.S.O. 1990, as amended, provides that the Notice requiring the hearing shall state:

1. The portions of the approval or condition in the approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

In addition to these legal requirements, the Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The Permit to Take Water number;
6. The date of the Permit to Take Water;
7. The name of the Director;
8. The municipality within which the works are located;

The Notice must be signed and dated by you.

This Notice must be served upon:

The Tribunal Secretary
Environmental Review Tribunal
P.O. Box 2382
2300 Yonge Street, Suite 1201
Toronto, Ontario
M4P 1E4

and

The Director, Section 34
Ontario Water Resources Act, R.S.O. 1990
Ministry of the Environment
5775 Yonge Street, 8th Floor
Toronto, Ontario
M2M 4J1

Further information on the requirements for an appeal of the Environmental Review Tribunal can be obtained directly from the Tribunal Secretary by telephone (416) 314-4600, fax (416) 314-4506 or on the web site www.ert.gov.on.ca

DATED AT TORONTO this *23rd* day of *December*, 2003.

Burlington - Nelson Aggregate / Nelson Asphalt

History

Operational Pictures

The Burlington Quarry formally known as the Nelson Quarry because it was located on the Niagara Escarpment just north of the Village of Nelson that was historically located at the corners of Dundas St. (Hwy 5 and Guelph Line). It is has been merged with the City of Burlington for so long that all the remains is a historical sign at the corner and a few institutions that carry its name. When the compa was first started it adopted Nelson as its name and to distinguish the Quarry from the parent company. It is referred to as the Burlington Quarry within Nelson Aggregate Co. <Location>

The quarry was started in 1952 by King Paving and Materials Limited. In 1974 King Paving Materials. The company was subsequently purchased by the Flintkote Co of Canada Ltd. Flintkote was later acquired by Genstar Stone Products Inc in 1980 who sold the quarry in 1983 to the current owner Nelson Aggregate Co.

Products

Product List:

Armour stone
Rip Rap
Gabion Stone
Clear stone (concrete, asphalt and drainage stone)
Crusher run products (granulars)
Screening
Recycled Product blends using reclaimed concrete and asphalt
(see Nelson Asphalt)

Product applications include:

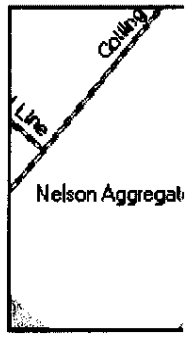
Sewer & Watermain Pipe Bedding & Pipe Cover
Road Base Granulars
Recycled Granulars
Natural Landscape & Erosion Control Products
Block Precast & Ready Mix Concrete Aggregates

Commercial, Industrial & Residential Aggregates <return to menu>

Our customers include:

All local Municipalites
Concrete, Asphalt, and Block Plants
Sewer & Watermain & Road Construction Companies
Residential Housing and Development Companies
Landscapers and interlocking companies
Local Retail Sales

Quality Control Statement



Our on site Type C Lab has been certified by the Council of Independent Laborat and meets all the Proficency Tests requested by the Ministry of Transportation. C products are consistantly listed on the MTO concrete and aggregate list as a proc choice. Our on site lab allows us to constantly monitor our products and to consta adjust for variations in processing this natural resource, thereby maintaining prod quality and specifications.

Location

Located on the Niagara Escarpment with easy access to major transportation routes such as the QEW, and Highways 401, 403, 407, 25, 5, and 6 we Service the Hamilton to Metro Toronto area and from Lake Ontario to Highway 401 with Diversified Quality Limestone Products and Reliable Service!

Incident Report Reference Number (IRRN): 2158-7YKQV9

Inspection Report Summary

On September 1, 2009 Officer's Copland and Hohner attended and inspected Burlington Springs G&C Club. Contact was made through the club's General Mgr Brad Bunkowsky. The purpose of the inspection was to ensure compliance with the sites PTTW, the PA and EPA. A current valid PTTW was produced # 6063-6JZPT7 and showed an expiry date of Dec. 31, 2015. The site's water taking consisted of 4 interconnecting ponds and a large powered pump at 90 lbs psi used for irrigation only. The water records were inspected and amounts used were not in contravention of the PTTW. The pesticides were stored properly in a vented room and the pesticide operator produced licence # F27027 under the name Andrew P. Barker. An emergency list of phone numbers was not posted outside the pesticide storage area and it appears the fire department has not been given an annual notice. Waste oil was being stored inside and outside the maintenance building in pails and a large storage drum. Secondary containment was not in use. Manifest # BN53876-0 was inspected and in compliance when the last shipment was sent of waste oil carried by Safety Kleen in July of 2009. A verbal warning was given for the minor infractions.

Field Inspection Observations

Checklist Name: **EPA - General Questions - Bronte Creek**

Act/Reg: **EPA|Act|157.1(1)(a)** **Non-Compliance Yes**

Act/Reg Wording: *A provincial officer may issue an order to any person who owns or who has management or control of an undertaking or property if the provincial officer reasonably believes that the requirements specified in the order are necessary or advisable so as,*

(a) to prevent or reduce the risk of a discharge of a contaminant into the natural environment from the undertaking or property;

Comments/Findings: Storage tank of waste oils outside without secondary containment

---

Act/Reg: **PA|Reg63/09|109(1)4** **Non-Compliance Yes**

Act/Reg Wording: *109 (1)4 A person who stores a Class 1, 2, 3, 4, 5, 6, 7 or 8 pesticide shall do so in accordance with the following rules:*

4. A list of emergency telephone numbers, including those of the fire department, hospital and poison control centre shall be prominently displayed near the area where the pesticide is stored.

Comments/Findings: Emergency signage not posted near Pesticide storage area

---

Recommended Actions

1. Post Emergency numbers outside Pesticide Storage area by April 30, 2010.

2. ensure all waste oils are stored in available containment apperatus with secondary containment by April 30, 2010.

3. Report pesticide products and classes to local Fire Department annually and location of storage using required form obtained from MOE district office.

4. Ensure a backflow preventer is always used when mixing pesticides to ensure drinking water supply is not contaminated.

This Inspection Report does not in any way suggest that there is or has been compliance with all applicable legislation and regulations as they may apply to this facility. It is, and remains, the responsibility of the owner and/or the operating authority to ensure compliance with all applicable legislative and regulatory requirements.

RE: Permit to Take Water Inspection

Dear Mr. Brunkowsky

I would like to thank you for the information provided during an inspection on 01 September 2009. The focus of the inspection was to assess compliance with the Environmental Protection Act, Ontario Regulation 63/09 under the Pesticides Act which has been amended by the Cosmetic Pesticides Ban Act 2008 and the Ontario Water Resources Act R.S.O 1990.

1. At the time of the inspection, the following were identified regarding the use of a back flow preventer when mixing pesticides with water from a direct source of drinking water. A back flow preventer must be used under these circumstances where the possibility of contaminating water due to back flow exists.

2. At the time of the inspection the following was identified regarding the storage of waste oils with the potential of contaminating the environment. Some waste oils were stored in pails without being covered inside the maintenance building and the waste oil outside was without secondary containment as required by EPA section 157.1(1)(a).

3. At the time of the inspection the following was identified regarding the posting of a list of emergency contact numbers outside the pesticide storage area. The list was not posted at the time of inspection as required by the Pesticide Act section 109(1)(4).

See Field Inspection Observations section of the attached Inspection Report for more detail.

I am requesting that the business take steps to address the issues identified during the inspection to come into compliance.

Dear Paul

Thank you for your follow up on the inspection of September 1, 2009.

I have complied with the issues that you listed in the following way:

1) we will use our filtered back flow preventer for the use of chemicals.

2) we have removed the open parts of the oil and have erected a containment for used oil storage.

2) we have posted emergency phone numbers on all our chemical storage.

Please be assured that I have seen to compliance and fulfillment of all issues of your report.

Yours truly,

Brad Bunkowsky

Permit To Take Water Inspection Report

Client:			
Mailing Address:			
Inspection Site Address:	Burlington Springs Golf 5235 Cedar Springs Rd		
Contact Name:	Brad Bunkowski	**Title:** Gen Mgr	
Contact Telephone:	905 335-2922	**Contact Fax:**	
Last Inspection Date:			
Inspection Start Date:		**Inspection Finish Date:**	
Region:			

1.0 INTRODUCTION

Prior to the inspection, complete a detailed file review which may include: approval applications, operation and design plans, authorizing/control documents, financial assurance, compliance history, analytical data, non-compliance reports, MOE databases and correspondence.
Establish the focus and limiting scope of the inspection. Was the whole facility inspected or were selected areas, processes, records or equipment inspected? What is the purpose of the inspection?
List the authorizing/control documents (ie. approvals, licences, permits, directions, program approvals or orders) which were reviewed and inspected and list any emission requirements or limits and any pertinent conditions which are required to directly protect human health or the environment.

2.0 INSPECTION OBSERVATIONS

Permit Number:

2.1 PURPOSE OF TAKING: - Irrigation

Specify the generic purpose for the water taking.

2.2 SYSTEM DESCRIPTION:

Surface water source: ○ Yes ○ No ○ N.A.

Ground water source: ○ Yes ○ No ○ N.A.

Describe the process used to extract water; i.e., number and type of wells, spring supply, river or other surface water source, number and size/capacity of pumps, storage facilities, flow measuring devices. Attach a flow diagram.

Diesel powered pump @ 90 psi.

2.3 QUANTITY ASSESSMENT:

Is the water taking consistent with the volume limits (maximum daily volume, quantity per hour) specified on the permit? What is the maximum taking/day? What is the basis for the assessment (ie. flow meter records, or calculations/estimates)? If the quantity is based on calculations or estimates, describe how the calculations or estimates were derived? If a meter is used, review as many readings as possible from the log in order to determine the maximum taking. If no meter is installed, obtain details of the equipment in order to calculate an estimate of the taking.

Pesticide Lic # [redacted]
Andrew P. Barker

s.21

2.4 ASSESSMENT OF OTHER PERMIT CONDITIONS:

Is the Water Taking in accordance with other significant terms and conditions on the application and the Permit? Typically, permits will specify: times of operation, monitoring/recording and reporting requirements. If no, specify terms and conditions not complied with.

Manifest # BNS 387 6-0
252L July
Safety Clean

2.5 ASSESSMENT OF REGULATION 387/04:

"Are water transfers outside the basin in accordance with the Regulation? Regulation 387/04 places very specific conditions under which water transfers out of a basin may take place. If the operation involves water transfer, assess it against these conditions.

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

Based on the prior file review, state if there are remaining non-compliance issues related to this inspection, as stated on: previous compliance reports, former inspection recommendations/actions, and all outstanding mandatory or voluntary abatement initiatives.

4.0 SUMMARY OF INSPECTION FINDINGS (HEALTH/ENVIRONMENTAL IMPACT)

Use the Compliance Guideline and the Delivery Strategies to determine appropriate procedure for ensuring that full and timely compliance is achieved

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate ?

○ Yes ○ No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material ?

○ Yes ○ No

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment ?

○ Yes ○ No

Specifics:

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material ?

○ Yes ○ No

Specifics:

Was there any indication of minor administrative non-compliance?

○ Yes ○ No

☐ Policy/Guideline(Non-conformance) ☐ Legal Requirement (Administrative)

Specifics:

Refer to the Informed Judgement Matrix as a guide in the selection of the pick-lists below.
The Informed Judgement Matrix section below will not show on the printed Inspection report.

Compliance History:

Health/Environmental Consequences:

IJM Score:

Compliance Level	IJM Score
In Compliance	A0 to F0
In Compliance with Comments	A1, B1 and C1
Non-Compliance	Other than above

5.0 ACTION(S) REQUIRED

Use the Compliance Guideline and the Delivery Strategies to determine appropriate procedure for ensuring that full and timely compliance is achieved.

6.0 OTHER INSPECTION FINDINGS

These are inspection findings, which do not trigger "Program Priorities" and may or may not be based on statutory requirements , but are significant to improving the operation. This is where the Environmental Officer can, for example, identify a contravention of a Ministry requirement which in itself may not trigger a "Program Priority", but may still require some action from the owner/operating authority. The Environmental Officer may also include suggested actions to be taken. This satisfies the requirements of "Document and File" of the Delivery Strategies.

7.0 INCIDENT REPORT

An incident report must be completed for all non-compliance,defined as a violation of any Act, Regulation or condition of a control or authorizing document, administered by the Ministry.
◯ Applicable ◯ Not Applicable

8.0 ATTACHMENTS

Required attachments:

- Secondary Containment
- oil in garage
- envelope #15
- Annual notice to F.D.

Mr. Brad Bunkowsky
Burlington Springs Golf & Country Club
5235 Cedar Springs Road
Burlington, Ontario, L0P 1B0
RE: Burlington Springs Golf & Country Club
Lot: 1, Concession: 2 and Lot: 2, Concession: 2
Burlington, Regional Municipality of Halton
Reference Number 1658-5VKLGW

Dear Mr. Bunkowsky,

Please find attached Permit No. **6063-6JZPT7** issued to the **Burlington Springs Golf & Country Club** which authorizes the withdrawal of water for golf course irrigation in accordance with the application for this Permit to Take Water, and Schedule "A" which is attached to and forms part of this Permit.

This Permit expires on **December 31, 2015.** The Permit must be kept available for inspection by Ontario Ministry of the Environment staff at all times.

Take notice that in issuing this Permit to Take Water, terms and conditions pertaining to the taking of water and to the results of the taking have been imposed on the **Burlington Springs Golf & Country Club.** The terms and conditions have been designed to allow for the development of water resources for beneficial purposes, while providing reasonable protection to existing water uses and users.

Be advised that, as per Condition 3.3 of this Permit, the Permit Holder shall ensure that no diversion of water to the irrigation ponds shall take place unless the flow below the weir structure and online pond is equal to or greater than 2 L/sec. The monitoring of water withdrawals from all sources listed in the Table A is required throughout the duration of this Permit, as per Condition 4.1. Also, condition 4.2 requires that all data collected be maintained and made available for Ministry inspection. In addition, as per Condition 4.3 of this Permit, inspections of the weir and bypass structures shall be conducted by a qualified person every two years and data should be kept at the site available for inspection by a Provincial Officer.

One of the purposes of the issuance of a Permit is to ensure that the permitted taking(s) will not cause negative impacts to the environment or other water supplies which were in use prior to the

date of this Permit. If the taking of water should result in any negative impacts, the Permit Holder will be required to restore the water supplies of those affected in a manner acceptable to the Ontario Ministry of the Environment or to reduce the rate and amount of taking until any negative impacts are eliminated.

Any change of address or ownership of the property for which this Permit is issued must be reported immediately to the Director.

The issuance of this Permit To Take Water does not relieve you from compliance with the legislative requirements of this or any other agencies. You must ensure that all legislated requirements relating to any use that may be made of this water have been met.

It is the responsibility of the **Burlington Springs Golf & Country Club** to ensure that any person taking water under the authority of this Permit is familiar with and complies with the terms and conditions.

Yours truly,

Ellen Schmarje

5235 Cedar Springs Road
Burlington, Ontario, L0P 1B0
Canada

For the water taking from: Four hydraulically connected irrigation ponds

Located at: Lot 1, Concession 2
Burlington, Regional Municipality of Halton

Lot 2, Concession 2
Burlington, Regional Municipality of Halton

For the purposes of this Permit, and the terms and conditions specified below, the following definitions apply:

DEFINITIONS

(a) "Director" means any person appointed in writing as a Director pursuant to section 5 of the OWRA for the purposes of section 34, OWRA.

(b) "Provincial Officer" means any person designated in writing by the Minister as a Provincial Officer pursuant to section 5 of the OWRA.

(c) "Ministry" means Ontario Ministry of the Environment.

(d) "District Office" means the Halton-Peel District Office.

(e) "Permit" means this Permit to Take Water No. 6063-6JZPT7 including its Schedules, if any, issued in accordance with Section 34 of the OWRA.

(f) "Permit Holder" means Burlington Springs Golf & Country Club.

(g) "OWRA " means the *Ontario Water Resources Act,* R.S.O. 1990, c. O. 40, as amended.

You are hereby notified that this Permit is issued subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

1. Compliance with Permit

1.1 Except where modified by this Permit, the water taking shall be in accordance with the application for this Permit To Take Water, dated December 18, 2003 and signed by Brad Bunkowsky, and all Schedules included in this Permit.

1.2 The Permit Holder shall ensure that any person authorized by the Permit Holder to take water under this Permit is provided with a copy of this Permit and shall take all reasonable measures to ensure that any such person complies with the conditions of this Permit.

1.3 Any person authorized by the Permit Holder to take water under this Permit shall comply with the conditions of this Permit.

1.4 This Permit is not transferable to another person.

1.5 This Permit provides the Permit Holder with permission to take water in accordance with the conditions of this Permit, up to the date of the expiry of this Permit. This Permit does not constitute a legal right, vested or otherwise, to a water allocation, and the issuance of this Permit does not guarantee that, upon its expiry, it will be renewed.

1.6 The Permit Holder shall keep this Permit available at all times at or near the site of the taking, and shall produce this Permit immediately for inspection by a Provincial Officer upon his or her request.

1.7 The Permit Holder shall report any changes of address to the Director within thirty days of any such change. The Permit Holder shall report any change of ownership of the property for which this Permit is issued within thirty days of any such change. A change in ownership in the property shall cause this Permit to be cancelled.

2. General Conditions and Interpretation

2.1 Inspections

The Permit Holder must forthwith, upon presentation of credentials, permit a Provincial Officer to carry out any and all inspections authorized by the OWRA, the *Environmental Protection Act* , R.S.O. 1990, the *Pesticides Act* , R.S.O. 1990, or the *Safe Drinking Water Act,* S. O. 2002.

2.2 Other Approvals

The issuance of, and compliance with this Permit, does not:

(a) relieve the Permit Holder or any other person from any obligation to comply with any other applicable legal requirements, including the provisions of the *Ontario Water Resources Act* , and the *Environmental Protection Act* , and any regulations made thereunder; or

(b) limit in any way the authority of the Director or a Provincial Officer to require certain steps be
taken or to require the Permit Holder to furnish any further information related to this Permit.

2.3 Information

The receipt of any information by the Ministry, the failure of the Ministry to take any action or require any person to take any action in relation to the information, or the failure of a Provincial Officer to prosecute any person in relation to the information, shall not be construed as:

(a) an approval, waiver or justification by the Ministry of any act or omission of any person that contravenes this Permit or other legal requirement; or

(b) acceptance by the Ministry of the information's completeness or accuracy.

2.4 Rights of Action

The issuance of, and compliance with this Permit shall not be construed as precluding or limiting any legal claims or rights of action that any person, including the Crown in right of Ontario or any agency thereof, has or may have against the Permit Holder, its officers, employees, agents, and contractors.

2.5 Severability

The requirements of this Permit are severable. If any requirements of this Permit, or the application of any requirements of this Permit to any circumstance, is held invalid or unenforceable, the application of such requirements to other circumstances and the remainder of this Permit shall not be affected thereby.

2.6 Conflicts

Where there is a conflict between a provision of any submitted document referred to in this Permit, including its Schedules, and the conditions of this Permit, the conditions in this Permit shall take precedence.

3. Water Takings Authorized by This Permit

3.1 Expiry

This Permit expires on **December 31, 2015**. No water shall be taken under authority of this Permit after the expiry date.

3.2 Amounts of Taking Permitted

The Permit Holder shall only take water from the source, during the periods and at the rates and amounts of taking specified in Table A. Water takings are authorized only for the purposes specified in Table A.

Table A

	Source Name / Description:	Source: Type:	Taking Specific Purpose:	Taking Major Category:	Max. Taken per Minute (litres):	Max. Num. of Hrs Taken per Day:	Max. Taken per Day (litres):	Max. Num. of Days Taken per Year:	Zone/ Easting/ Northing:
1.	Irrigation Ponds (four hydraulically connected) Lot: 1, Con: 2	Pond Online	Golf Course Irrigation	Commercial	2270.00	24.00	2692000.00	183.00	17 589400 4805050
						Total Taking:	2692000.00		

3.3 The Permit Holder shall ensure that no diversion of water to the irrigation ponds shall take place unless the flow below the weir structure and online pond is equal to or greater than 2 L/sec (weir pond elevation is equal to or higher than 269.125 MSL). Weir structure is located just upstream of Colling Road culvert (N4805610, E589000).

4. Monitoring

4.1 The Permit Holder shall monitor all takings from the irrigation ponds with flow meters to measure rates and amounts of water taking. Each meter shall be maintained in operational condition and all units calibrated for accuracy as per the manufacturer's specifications.

4.2 The Permit Holder shall maintain a record of all water takings from the irrigation ponds. This record shall include the dates and times of water takings and the total measured amounts of water pumped per day for each day that water is taken under the authorization of this Permit. The Permit Holder shall keep all required records up-to-date and available for Ministry inspection.

4.3 The Permit Holder shall undertake inspections of the weir and bypass structures by a qualified person every two years to ensure its performance as required by condition 3.3. The Permit

Holder shall keep the records of these inspections with an analysis of the data at the site available for Ministry staff upon request.

5. Impacts of the Water Taking

5.1 Notification

The Permit Holder shall immediately notify the local District Office of any complaint arising from the taking of water authorized under this Permit and shall report any action which has been taken or is proposed with regard to such complaint. The Permit Holder shall immediately notify the local District Office if the taking of water is observed to have any significant impact on the surrounding waters. After hours, calls shall be directed to the Ministry's Spills Action Centre at 1-800-268-6060.

5.2 For Surface-Water Takings

The taking of water (including the taking of water into storage and the subsequent or simultaneous withdrawal from storage) shall be carried out in such a manner that streamflow is not stopped and is not reduced to a rate that will cause interference with downstream uses of water or with the natural functions of the stream.

5.3 The Permit Holder and their agents shall be responsible for ensuring that no undesirable effects occur as a result of water taking under the authority of this Permit. A record of complaints relating to the Permit Holder's water taking strategy and actions taken to address these complaints must be maintained by the Permit Holder and kept available for review by Ministry staff.

6. Director May Amend Permit

The Director may amend this Permit by letter requiring the Permit Holder to suspend or reduce the taking to an amount or threshold specified by the Director in the letter. The suspension or reduction in taking shall be effective immediately and may be revoked at any time upon notification by the Director. This condition does not affect your right to appeal the suspension or reduction in taking to the Environmental Review Tribunal under the *Ontario Water Resources Act* , Section 100 (3).

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is included to ensure that the conditions in this Permit are complied with and can be enforced.

2. Condition 2 is included to clarify the legal interpretation of aspects of this Permit.

3. Conditions 3 through 6 are included to protect the quality of the natural environment so as to safeguard the ecosystem and human health and foster efficient use and conservation of waters. These conditions allow for the beneficial use of waters while ensuring the fair sharing, conservation and sustainable use of the waters of Ontario. The conditions also specify the water takings that are authorized by this Permit and the scope of this Permit.

In accordance with Section 100 of the Ontario Water Resources Act, R.S.O. 1990, you may by written notice served upon me, the Environmental Review Tribunal and the Environmental Commissioner, ***Environmental Bill of Rights****, R.S.O. 1993, Chapter 28, within 15 days after receipt of this Notice, require a hearing by the Tribunal. The Environmental Commissioner will place notice of your appeal on the Environmental Registry. Section 101 of the Ontario Water Resources Act, as amended provides that the Notice requiring a hearing shall state:*

1. The portions of the Permit or each term or condition in the Permit in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

In addition to these legal requirements, the Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The Permit to Take Water number;
6. The date of the Permit to Take Water;
7. The name of the Director;
8. The municipality within which the works are located;

And the Notice should be signed and dated by the appellant.

This notice must be served upon:

Subject:	Comments on Application
Created by:	Isabelle Drouin-Brisebois
File Storage Number:	SI-YD-MA-C5-220

January 26, 2004

Upon issuance, this amendment will revoke and replace the existing PTTW 00-P-3072. I did not include the taking from the Bronte Creek diversion in the table of the IDS PTTW Main Document, as it involves threshold conditions. This should be added to the Permit as an additional condition in Section 3, or in the form of a table in that section. I have called the consultant R. Lee Van Biesbrouck, Metropolitan Consulting Inc., and asked for additional information about the takings including the capacity of the well pump.

January 30, 2004

Spoke with Lee Van Biesbrouck and he said that he was not sure of the capacity of the pump but that he expected between 6 and 10 USgpm and that it would be of use all year for up to 24 hours per day. I have adjusted the /min rate in the main document to reflect a 10 USgpm maximum rate.

AMENDED PERMIT TO TAKE WATER
Surface Water
NUMBER 6063-6JZPT7

Pursuant to Section 34 of the Ontario Water Resources Act, R.S.O. 1990 this Permit To Take Water is hereby issued to:

Burlington Springs Golf & Country Club
5235 Cedar Springs Road
Burlington, Ontario, L0P 1B0
Canada

For the water taking from: Four hydraulically connected irrigation ponds

Located at: Lot 1, Concession 2
Burlington, Regional Municipality of Halton

Lot 2, Concession 2
Burlington, Regional Municipality of Halton

For the purposes of this Permit, and the terms and conditions specified below, the following definitions apply:

DEFINITIONS

(a) "Director" means any person appointed in writing as a Director pursuant to section 5 of the OWRA for the purposes of section 34, OWRA.

(b) "Provincial Officer" means any person designated in writing by the Minister as a Provincial Officer pursuant to section 5 of the OWRA.

(c) "Ministry" means Ontario Ministry of the Environment.

(d) "District Office" means the Halton-Peel District Office.

(e) "Permit" means this Permit to Take Water No. 6063-6JZPT7 including its Schedules, if any, issued in accordance with Section 34 of the OWRA.

(f) "Permit Holder" means Burlington Springs Golf & Country Club.

(g) "OWRA " means the *Ontario Water Resources Act,* R.S.O. 1990, c. O. 40, as amended.

You are hereby notified that this Permit is issued subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

1. Compliance with Permit

1.1 Except where modified by this Permit, the water taking shall be in accordance with the application for this Permit To Take Water, dated December 18, 2003 and signed by Brad Bunkowsky, and all Schedules included in this Permit.

1.2 The Permit Holder shall ensure that any person authorized by the Permit Holder to take water under this Permit is provided with a copy of this Permit and shall take all reasonable measures to ensure that any such person complies with the conditions of this Permit.

1.3 Any person authorized by the Permit Holder to take water under this Permit shall comply with the conditions of this Permit.

1.4 This Permit is not transferable to another person.

1.5 This Permit provides the Permit Holder with permission to take water in accordance with the conditions of this Permit, up to the date of the expiry of this Permit. This Permit does not constitute a legal right, vested or otherwise, to a water allocation, and the issuance of this Permit does not guarantee that, upon its expiry, it will be renewed.

1.6 The Permit Holder shall keep this Permit available at all times at or near the site of the taking, and shall produce this Permit immediately for inspection by a Provincial Officer upon his or her request.

1.7 The Permit Holder shall report any changes of address to the Director within thirty days of any such change. The Permit Holder shall report any change of ownership of the property for which this Permit is issued within thirty days of any such change. A change in ownership in the property shall cause this Permit to be cancelled.

2. General Conditions and Interpretation

2.1 Inspections

The Permit Holder must forthwith, upon presentation of credentials, permit a Provincial Officer to carry out any and all inspections authorized by the OWRA, the *Environmental Protection Act* , R.S.O. 1990, the *Pesticides Act* , R.S.O. 1990, or the *Safe Drinking Water Act,* S. O. 2002.

2.2 Other Approvals

The issuance of, and compliance with this Permit, does not:

(a) relieve the Permit Holder or any other person from any obligation to comply with any other applicable legal requirements, including the provisions of the *Ontario Water Resources Act* , and the *Environmental Protection Act* , and any regulations made thereunder; or

(b) limit in any way the authority of the Director or a Provincial Officer to require certain steps be
taken or to require the Permit Holder to furnish any further information related to this Permit.

2.3 Information

The receipt of any information by the Ministry, the failure of the Ministry to take any action or require any person to take any action in relation to the information, or the failure of a Provincial Officer to prosecute any person in relation to the information, shall not be construed as:

(a) an approval, waiver or justification by the Ministry of any act or omission of any person that contravenes this Permit or other legal requirement; or

(b) acceptance by the Ministry of the information's completeness or accuracy.

2.4 Rights of Action

The issuance of, and compliance with this Permit shall not be construed as precluding or limiting any legal claims or rights of action that any person, including the Crown in right of Ontario or any agency thereof, has or may have against the Permit Holder, its officers, employees, agents, and contractors.

2.5 Severability

The requirements of this Permit are severable. If any requirements of this Permit, or the application of any requirements of this Permit to any circumstance, is held invalid or unenforceable, the application of such requirements to other circumstances and the remainder of this Permit shall not be affected thereby.

2.6 Conflicts

Where there is a conflict between a provision of any submitted document referred to in this Permit, including its Schedules, and the conditions of this Permit, the conditions in this Permit shall take precedence.

3. Water Takings Authorized by This Permit

3.1 **Expiry**

This Permit expires on **December 31, 2015**. No water shall be taken under authority of this Permit after the expiry date.

3.2 Amounts of Taking Permitted

The Permit Holder shall only take water from the source, during the periods and at the rates and amounts of taking specified in Table A. Water takings are authorized only for the purposes specified in Table A.

Table A

	Source Name / Description:	Source: Type:	Taking Specific Purpose:	Taking Major Category:	Max. Taken per Minute (litres):	Max. Num. of Hrs Taken per Day:	Max. Taken per Day (litres):	Max. Num. of Days Taken per Year:	Zone/ Easting/ Northing:
1.	Irrigation Ponds (four hydraulically connected) Lot: 1, Con: 2	Pond Online	Golf Course Irrigation	Commercial	2270.00	24.00	2692000.00	183.00	17 589400 4805050
						Total Taking:	2692000.00		

3.3 The Permit Holder shall ensure that no diversion of water to the irrigation ponds shall take place unless the flow below the weir structure and online pond is equal to or greater than 2 L/sec (weir pond elevation is equal to or higher than 269.125 MSL). Weir structure is located just upstream of Colling Road culvert (N4805610, E589000).

4. Monitoring

4.1 The Permit Holder shall monitor all takings from the irrigation ponds with flow meters to measure rates and amounts of water taking. Each meter shall be maintained in operational condition and all units calibrated for accuracy as per the manufacturer's specifications.

4.2 The Permit Holder shall maintain a record of all water takings from the irrigation ponds. This record shall include the dates and times of water takings and the total measured amounts of water pumped per day for each day that water is taken under the authorization of this Permit. The Permit Holder shall keep all required records up-to-date and available for Ministry inspection.

4.3 The Permit Holder shall undertake inspections of the weir and bypass structures by a qualified person every two years to ensure its performance as required by condition 3.3. The Permit

Holder shall keep the records of these inspections with an analysis of the data at the site available for Ministry staff upon request.

5. Impacts of the Water Taking

5.1 Notification

The Permit Holder shall immediately notify the local District Office of any complaint arising from the taking of water authorized under this Permit and shall report any action which has been taken or is proposed with regard to such complaint. The Permit Holder shall immediately notify the local District Office if the taking of water is observed to have any significant impact on the surrounding waters. After hours, calls shall be directed to the Ministry's Spills Action Centre at 1-800-268-6060.

5.2 For Surface-Water Takings

The taking of water (including the taking of water into storage and the subsequent or simultaneous withdrawal from storage) shall be carried out in such a manner that streamflow is not stopped and is not reduced to a rate that will cause interference with downstream uses of water or with the natural functions of the stream.

5.3 The Permit Holder and their agents shall be responsible for ensuring that no undesirable effects occur as a result of water taking under the authority of this Permit. A record of complaints relating to the Permit Holder's water taking strategy and actions taken to address these complaints must be maintained by the Permit Holder and kept available for review by Ministry staff.

6. **Director May Amend Permit**

The Director may amend this Permit by letter requiring the Permit Holder to suspend or reduce the taking to an amount or threshold specified by the Director in the letter. The suspension or reduction in taking shall be effective immediately and may be revoked at any time upon notification by the Director. This condition does not affect your right to appeal the suspension or reduction in taking to the Environmental Review Tribunal under the *Ontario Water Resources Act* , Section 100 (3).

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is included to ensure that the conditions in this Permit are complied with and can be enforced.

2. Condition 2 is included to clarify the legal interpretation of aspects of this Permit.

3. Conditions 3 through 6 are included to protect the quality of the natural environment so as to safeguard the ecosystem and human health and foster efficient use and conservation of waters. These conditions allow for the beneficial use of waters while ensuring the fair sharing, conservation and sustainable use of the waters of Ontario. The conditions also specify the water takings that are authorized by this Permit and the scope of this Permit.

In accordance with Section 100 of the Ontario Water Resources Act, R.S.O. 1990, you may by written notice served upon me, the Environmental Review Tribunal and the Environmental Commissioner, ***Environmental Bill of Rights****, R.S.O. 1993, Chapter 28, within 15 days after receipt of this Notice, require a hearing by the Tribunal. The Environmental Commissioner will place notice of your appeal on the Environmental Registry. Section 101 of the Ontario Water Resources Act, as amended provides that the Notice requiring a hearing shall state:*

1. The portions of the Permit or each term or condition in the Permit in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

In addition to these legal requirements, the Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The Permit to Take Water number;
6. The date of the Permit to Take Water;
7. The name of the Director;
8. The municipality within which the works are located;

And the Notice should be signed and dated by the appellant.

This notice must be served upon:

The Secretary *Environmental Review Tribunal* *2300 Yonge Street, 12th Floor* *Toronto, Ontario M4P 1E4*	AND	*The Environmental Commissioner* *1075 Bay Street* *6th Floor, Suite 605* *Toronto, Ontario M5S 2W5*	AND	*The Director, Section 34* *Ontario Water Resources Act,* *RSO 1990,* *Ministry of Environment* *8th Floor* *5775 Yonge St* *Toronto ON M2M 4J1* *Fax: (416)325-6347*

Permit Technical Evaluation

Assess Complexity
Evaluate Risk for Impact:
The risk for impact is low and localized for prescribed amount and conditions of water taking from the irrigation ponds.

Boundary Assessment:
Extent of Impacts Anticipated:
Impacts limited to on-site, if water will be taken in accordance with stated terms and conditions of Permit to Take Water.

Assess Potential Effects on other Users (Interference):
Indications of past interference from this taking? ● Yes ○ No
Downstream users of intermittent watercourse that runs parallel to Colling Road have reported experiencing extremely low flows due interference from the diversion on summer 2004. Site inspections were conducted by MOE on July and October 2004. MOE letter in regard to these visits dated November 5, 2004 and signed by Leah Mohammed, Environmental Officer,

Halton-Peel District, has been sent on November 10, 2004 to Burlington Springs Golf and Country Club.

Assess Potential Effects on the Environment:

Surface Water:

Burlington Springs Golf and Country Club (BSG) have applied on December 18, 2003 for Permit amendment (PTTW No. 00-P-3072, expires on October 31, 2012).

The reason for this amendment is that the irrigation pump was moved from its former location to adjacent of the main irrigation pond, i.e. in a more central location with respect to the new irrigation ponds. The configuration of the intake structure and rated capacity of pump have not changed and therefore, withdrawal rate has not changed.

Current Permit (PTTW No. 00-P-3072) was issued on February 25, 2003. According to condition 17 of this Permit, the Permit Holder shall ensure that "the flow downstream of the on-line pond weir and the by-pass structure shall not be less than 2 L/s", i.e. once the flow below the weir structure drops to the 2 l/s or 25 IGPM (low flow threshold) the diversion to irrigation ponds must cease. To ensure implementation of this condition BSG installed bypass pipe and head box and reconstructed weir. The report "Stream Flow Rating Surveys, Burlington Springs Golf and Country Club, October 23, 2003 and May 16, 2005", prepared by Metropolitan Consulting Inc., summarizes of the stream flow surveys carried out at the reconstructed weir. First study (October 23, 2003) demonstrated that the bypass structure was not delivering the flow that was designed to provide (minimum flow rate is 2 L/s). As a result the inlet screen and the weir plate were modified to increase the bypass flow. The May 2005 survey verified that bypass and weir structures design maintains requested minimum flow rate of 2 L/s. Upgraded weir controls the split between the flow downstream and the recharge to the irrigation ponds and simultaneously provides minimum passing flow requirement.

Comments & Recommendations.

Based on the above-noted, the following has been agreed upon between MOE and the applicant (Metropolitan Consulting Inc. on behalf of the Burlington Springs Golf and Country Club):

- MOE to issue a 10 year PTTW amendment (for 2006 – 2015 seasons) that authorizes the club to operate as before (i.e. taking from four irrigation ponds and one potable water well upon demand);
- BCG should implement the conditions attached to the parts 3, 4 and 5 of the Permit.
- Based on the last report of Metropolitan Consulting Inc. (July 2005, minimum passing flow condition (2 L/s) should be modified to acknowledge the amount of time it takes to raise the water elevation in the weir pond to level (269.25 MSL), when the flow downstream of the on-line pond weir and the by-pass structure (at the Colling Road culvert) equals to 2 L/s.

Permit To Take Water Inspection Report

Client:	Burlington Springs Golf & Country Club Mailing Address: 5235 Cedar Springs Road, Burlington, Ontario, Canada, L0P 1B0 Physical Address: 5235 Cedar Springs Road, Concession: , Plan: , Burlington, City, Regional Municipality of Halton, Ontario, Canada, L0P 1B0 Telephone: (905)335-2922, FAX: (905)335-2932 Client #: 7984-5MHKEN, Client Type: Partnership, NAICS: 71391		
Inspection Site Address:	Burlington Springs Golf & Country Club Address: 5235 Cedar Springs Road, Concession: , Plan: , Burlington, City, Regional Municipality of Halton, L0P 1B0 District Office: Halton-Peel		
Contact Name:	Brad Bunkowsky	**Title:**	Club Manager
Contact Telephone:	(905)335-2922 **ext**	**Contact Fax:**	(905)335-2932
Last Inspection Date:	2003/09/26		
Inspection Start Date:	2004/06/03	**Inspection Finish Date:**	2004/06/03
Region:	Central		

1.0 INTRODUCTION

-The purpose of the inspection is to ensure that conditions of Permit to Take Water (PTTW) 00-P-3072 have been complied with, and to follow up the previous inspection conducted on September 26, 2003. The authority and issuance of the PTTW resides in Section 34 of the Ontario Water Resources Act, and Ontario Regulation 285/99.
-The current PTTW is 00-P-3072 and was issued on February 25, 2003. This permit expires on Oct 31, 2012.
-The current permit allows for a maximum taking of 2,720,000 Litres/day and 167,440,000 Litres for the season (May 1 to Oct 30.)

2.0 INSPECTION OBSERVATIONS

Permit Number:
00-P-3072

2.1 PURPOSE OF TAKING:

Irrigation

Additional Comments:

2.2 SYSTEM DESCRIPTION:

Surface water source: Yes

Ground water source: Yes

- The Club has a well onsite that is used solely as a water supply for the clubhouse.
- Surface water is used for irrigation and is diverted from an unnamed tributary of Bronte Creek. The Club is downstream of Nelson Quarry which discharges into a stream that flows along Colling Road onto the property into an online pond. The water is diverted either into a series of ponds on the property or continues through a weir structure designed to ensure appropriate discharge to downstream water users. The weir was designed and installed by Metropolitan Consulting last year.
- There is a series of storage ponds on the property but water is pumped from one main pond using a centrifugal pump powered

by a diesel engine. The pump is located near the 11th fairway. It is noted that a spill containment barrier was installed around the pump this year to guard against spills.
- The Club has a system of sprinkler heads installed on the course. These are used interchangeably with sprinklers to irrigate the golf course.
- There is a spigot system used to aerate the storage ponds.

2.3 QUANTITY ASSESSMENT:

- Due to the heavy rainfall experienced in the area the Club has not had to irrigate yet this spring. Therefore, no records were collected at this inspection.

2.4 ASSESSMENT OF OTHER PERMIT CONDITIONS:

- The club has made all required submissions to Tech Support at this time.

2.5 ASSESSMENT OF REGULATION 285/99:

There are no transfers of water occurring.

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

- At the previous inspection, it was noted that the main pump's location had been moved in contravention to Schedule 'A' of the PTTW. As required, the company has submitted an application to amend the PTTW. The application is currently being reviewed by the Technical Support Section in Central Region.

4.0 SUMMARY OF INSPECTION FINDINGS (HEALTH/ENVIRONMENTAL IMPACT)

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate ?
No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material ?
No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment ?
No

Specifics:

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material ?
No

Specifics:

5.0 ACTION(S) REQUIRED

None at this time.

6.0 OTHER INSPECTION FINDINGS

- It is noted that Halton Region Conservation Authority still has issues with this facility. They are receiving regular complaints from the downstream water users and are unsatisfied with the construction of the bypass pipe. These issues will be addressed at a later date.

Dear Maria Strybos:

RE: MECP FOI A-2024-05873 – Extension Letter

This letter is further to your request made pursuant to the Freedom of Information and Protection of Privacy Act (the Act) relating to:

> Lot 2, 3, and 4 Conc 1 and 2 (Known historic Lot 2,3,4 Conc 2,3) Nelson, Burlington
> Timeframe: January 1st, 1900 to September 4th, 2024

Please be assured that we are making every attempt to respond to your request as soon as possible. However, we wish to advise you that we have extended the time for a response in accordance with subsection 27(1)(a) of the Act for an additional 30 days to November 04, 2024.

The reason for the extension is that the request necessitates a search through a large number of records, approximately **500 pages**, and meeting the time limit would unreasonably interfere with the operations of the institution. If you would like to reduce this extension by narrowing the scope of your request, please contact our office.

You may request a review of my decision within 30 days from the date of this letter by contacting the Information and Privacy Commissioner/Ontario at http://www.ipc.on.ca. Please note there may be a fee associated with submitting the appeal.

If you have any questions, please contact Daniela Jaramillo at daniela.jaramillo@ontario.ca.

Yours truly,
Daniela Jaramillo

Attachment

Under the Environmental Protection Act and the regulations and subject to the limitations thereof, this Provisional Certificate of Approval is issued to:

The Corporation of the City of Burlington
P.O. Box 5013
426 Brant Street
Burlington, Ontario
L7R 3Z6

for the post-closure maintenance and monitoring of a 14.8 hectare previously landfilled area within a total site area of 28.00 hectares

all in accordance with the following plans and specifications:

as listed in Schedule "A"

Located at: Part of Lots 2 and 3, Concession 1 and 2
City of Burlington

and subject to the following conditions:

DEFINITIONS OF TERMS

1. In this Provisional Certificate of Approval:

   a) "Certificate" means this Provisional Certificate of Approval No. A210103, as amended from time to time, including all Schedules attached to and forming part of this Certificate;

   b) "City" means the Corporation of the City of Burlington;

   c) "Director" means one or more persons who from time to time are appointed under Section 5 of the Environmental Protection Act;

   d) "Regional Director" means the Director, Central Region, the Ministry of Environment and Energy;

   e) "MOEE" means the Ministry of Environment and Energy;

   f) "Landfill" or "Property" means part of Lots 2 and 3, Concession 1 and 2 in the City of Burlington comprising the landfill site as shown on Drawing 1 of Item 3, Schedule "A";

g) "ODWO" means the Ontario Drinking Water Objectives dated February 27, 1964, revised 1994 (and or amended);

h) RUPO means the Ontario Ministry of Environment and Energy's Reasonable Use Policy Objectives (Guidelines B-7);

i) "PWQO" means the Provisional Water Quality Objectives dated July 1994 (and or amended).

GENERAL

2. This Certificate revokes all previously issued Provisional Certificates of Approval issued under Part V of the Environmental Protection Act for this site. The approval given herein including the terms and conditions set out, replaces all previously issued approvals and related terms and conditions under Part V of the Act for this site.

3. (a) Pursuant to Section 197 of the Environmental Protection Act, the City is prohibited from dealing with Property in any way without first giving a copy of this Certificate to each person acquiring an interest in the Property as a result of the dealing.

(b) The City shall:

i) Within 60 days of the date of this Certificate, submit to the Director a completed Certificate of Prohibition, together with a registrable description of the Property as set out in ss. 197(1) of the Act, for the Director's signature.

ii) Upon receiving a copy of the Certificate of Prohibition signed by the Director, register the Certificate of Prohibition on title and forthwith forward to the Director proof that this has been completed.

4. Requirements specified in this Certificate are minimum requirements and do not abrogate the need to take all reasonable steps to avoid violating the provisions of other applicable legislation, regulations, approvals, orders, etc.

5. The requirements of this Certificate are severable. If any requirement of this Certificate to any circumstances is held invalid, the application of such requirement to other circumstances and the remainder of this Provisional Certificate of Approval shall not be affected thereby.

6. The City shall allow MOEE personnel, or a MOEE authorized representative(s), upon presentation of credentials, to:

   a) carry out any and all inspections authorized by the Environmental Protection Act, the Ontario Water Resources Act or the Pesticides Act, as amended from time to time, of any place to which this Certificate relates, and

   without restricting the generality of the foregoing, to:

   b) i) enter upon the premises or the location where the records required by the conditions of this Certificate are kept;

   ii) have access to and copy, at any reasonable time, any records required by the conditions of this Certificate;

   iii) inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices or operations required by the conditions of this Certificate.

7. The Landfill shall be monitored and maintained by the City in accordance with all documents listed in Schedule "A". Should there be discrepancies between the documents listed in Schedule "A" and the conditions in this Certificate, the conditions shall take precedence. Should there be discrepancies between the documents listed in Schedule "A", the document bearing the most date shall take precedence.

8. The final cover shall be inspected twice a year in March/April and July to evaluate its integrity and continuity. Should inspection identify any problem regarding the final cover integrity and/or continuity, necessary measures shall be undertaken by the City within five working days, weather permitting.

9. Within 180 days of the issuance of this Certificate the City shall submit to the Regional Director's approval the regular leachate collection system inspection plan. This plan shall be implemented immediately upon its approval by the Regional Director.

LEACHATE MONITORING

10. Leachate monitoring shall be undertaken by the City in accordance with Schedule "B".

GROUNDWATER MONITORING

11. Groundwater monitoring shall be undertaken by the City in accordance with Schedule "C".

12. If continued monitoring indicates leachate related deterioration of groundwater quality at the downgradient attenuation zone boundary, then the City shall submit to the Regional Director for approval, the groundwater trigger mechanism to be used for contingency measures implementation. The trigger mechanism shall include trigger locations, the list of trigger parameters, and trigger concentrations/criteria.

SURFACE WATER MONITORING

13. Surface water monitoring shall be undertaken by the City in accordance with Schedule "D".

14. If continued monitoring indicates landfill related deterioration of surface water quality downstream of the Landfill then the City shall submit to the Regional Director for approval the surface water trigger mechanism for contingency measures implementation. This trigger mechanism shall include trigger locations, the list of trigger parameters, and trigger concentration/criteria.

LANDFILL GAS MONITORING

15. Monitoring of the Landfill's gases shall be undertaken by the City in accordance with Schedule "E".

CHANGES IN MONITORING PROGRAMS

16. Each of Schedules B, C, D, E and F shall be reviewed annually and modified, if warranted, based on the most recent monitoring results. Recommendations for changes in monitoring programs shall be documented in the annual monitoring report and approved by the Regional Director.

ANNUAL REPORT

17. The City shall prepare and submit an annual report to the Regional Director by June 1st of the year following the calendar year covered by the report which shall include as a minimum, the following:

    a) a drawing(s) of the Landfill indicating all groundwater, surface water and gas monitoring locations;

    b) tables outlining monitor locations, analytical parameters sampled, and frequency of sampling;

c) an analysis and interpretation of the surface water, groundwater, leachate, and gas monitoring data; a review of the adequacy of the monitoring programmes; conclusions of the monitoring data; and recommendations for any changes in monitoring programmes that may be necessary;

d) an assessment of groundwater quality in relation to the RUPO, ODWO and trigger concentrations mentioned in Condition 12;

e) an assessment of surface water quality with respect to the PWQO/Guidelines;

f) an assessment of leachate quality and quantity;

g) an assessment of the leachate collection system performance;

h) an assessment of the performance of the attenuation zone;

i) an update of changes in maintenance at the Landfill, and any associated difficulties encountered;

j) recommendations respecting any proposed changes in the Landfill maintenance and monitoring;

k) a statement as to compliance with all Conditions and with the inspection and reporting requirements of the Conditions;

l) a summary of any complaints made regarding Landfill maintenance and monitoring and the City's response and action taken.

SCHEDULE "A"

This Schedule "A" forms part of Provisional Certificate of Approval No. A 210103 *and contains documentation submitted in support of an application for the post-closure maintenance, monitoring and use of the Landfill.*

1. Revised Final Report, Environmental Investigation, Jannock Properties Development Lands, Burlington, Ontario prepared by Golder Associates Limited and dated January, 1994.

2. Survey Plans 20R-11536 and 20R-11537 dated September 1, 1994.

3. Environmental Performance Report, Bayview Park Landfill, Burlington, Ontario prepared by Conestoga-Rovers & Associates Limited and dated November, 1994.

4. 1995 Monitoring Report, Bayview Park Landfill Site, Burlington, Ontario prepared by Conestoga-Rovers & Associates Limited and dated March 1996.

5. Application for approval of a Waste Disposal Site dated December 7, 1995.

6. Letter dated January 31, 1996, Conestoga-Rovers to Mr. E. Zaltsberg of MOEE, Subject: Response to MOEE comments of January 17, 1996.

7. Revised Table 8.1, Site Monitoring Specification, prepared by Conestoga-Rovers and dated January 31, 1996.

8. Letter dated February 6, 1996, Conestoga-Rovers to Mr. E. Zaltsberg of MOEE, Subject: Application to amend the Certificate of Approval No. A 210103.

9. Letter dated April 22, 1996, Conestoga-Rovers to Mr. E. Zaltsberg of MOEE, Subject: Land Acquisition for Establishing the Buffer Zone.

SCHEDULE "B"

This Schedule "B" forms part of Provisional Certificate of Approval No. A 210103. *It describes the leachate monitoring program referred to in Condition 10.*

B.1. OBJECTIVE

The objective of this program is to perform a long-term leachate quality and quantity assessment for the purpose of evaluating the leachate collection system performance.

B.2. MONITORING PLAN

The leachate monitoring program shall be carried out by the City to address the stated objectives and shall include:

B.2.1 Monitoring of leachate level

Locations: 6 Leachate Wells LW1, LW2, LW3, LW4, LW5, LW6

Monitoring Frequency: Twice per year in March and July

Types of Monitoring:

i) measure the depth of each leachate well;

ii) monitor and record leachate level in each well

B.2.2 Leachate Flow Measurements

Location: pumping stations 2 and 3

Monitoring Frequency: continuously

B.2.3 Monitoring of Leachate Quality

Location: 1 manhole MH15

Monitoring frequency: Once per year in March

Analysis:

General Chemistry*

Metals & Cyanide*

VOCs*

BNAEs*

Oil and Grease*

B.2.4 **Leachate Seep Inspection**

Walk over the entire landfill with special attention to be given to 9 known leachate seeps: LS1, LS2, LS3, LS4, LS5, LS6, LS7, LS8, LS9

Monitoring Frequency: Twice per year, in March and July

Types of Monitoring:

i) identify any leachate seep that has re-occurred
ii) estimate flow rate at the seep when it is possible, and report it in L/sec or gpm
iii) complete leachate seep inspection sheets
iv) report any occurrences of leachate seeps or failure of leachate collection system

B.2.5. **Leachate Collection System Inspection**

The leachate collection system inspection shall be performed in accordance with the program mentioned in condition 9.

* See Schedule "F"

SCHEDULE "C"

This Schedule "C" forms part of Provisional Certificate of Approval No. A 210103. *It describes the groundwater monitoring program referred to in Condition 11.*

C.1. MONITORING PROGRAM OBJECTIVES

to monitor groundwater quality within and at the buffer zone boundary;

to identify and characterize movement of leachate - related contaminants at the site/buffer zone boundary;

to evaluate the effectiveness of the established buffer zone; and

to evaluate the efficiency of the leachate collection system

C.2. MONITORING PLAN

The groundwater monitoring program shall be carried out by the City to address the stated objectives and shall include:

C.2.1 Monitoring of Groundwater Level

Locations:

PW3, OW1A-93, OW1B-93, OW2A-93, OW2B-93, OW3-93, OW4-93

Monitoring frequency: Twice per year in March and July

C.2.2 **Monitoring of Groundwater Quality**

Locations:

PW3, OW1A-93, OW1B-93, OW2A-93, OW2B-93, OW3-93, OW4-93

Monitoring Frequency: Twice per year in March and July

Analysis:

General Chemistry*, VOCs*, Metals*

All observation wells to be sampled shall be purged at least 5 well casing volume or dry prior to sampling.

C.3 **MONITORING SYSTEM MAINTENANCE**

During each monitoring event, the monitoring network shall be visually inspected by the City. Changes in the physical condition of each well shall be noted and necessary repairs undertaken.

Operational monitoring wells that are shown to be damaged beyond repair or whose integrity is in doubt for further monitoring, shall be abandoned in accordance with standard procedures and replaced, if necessary.

Existing non-operational monitoring wells shall be abandoned in accordance with standard procedures.

* See Schedule "F"

SCHEDULE "D"

This Schedule "D" forms part of Provisional Certificate of Approval No. A 210103. *It describes the surface water monitoring program referred to in condition 13.*

D.1 OBJECTIVES

The objectives of this program are:

to evaluate the Landfill's impact on surface water quality downstream of the Landfill;

to evaluate the effectiveness of the buffer zone; and

to evaluate the efficiency of the leachate collection system.

D.2. MONITORING PLAN

The surface water monitoring program shall be carried out by the City to address the stated objectives and shall include:

D.2.1. **Flow Measurement**

Locations: SW9A-93, SW13-93, SW14-93 and SW15-93

Monitoring Frequency:
Twice per year in March and July . If July event is dry, a third event is to be scheduled in the fall

D.2.2 **Monitoring of Surface Water Quality**

Locations:

Upstream: SW9A-93, SW11-87
Landfill Vicinity: SW1-87, SW3-87, SW5-87
Downstream: SW13-93, SW14-93, SW15-93

Monitoring Frequency: An indicated in D.2.1 above

Analysis: General Chemistry*, Bacteria*, VOCs*

If phenols are detected in the leachate at MH15 during two consecutive events, then phenols are to be added to the above - mentioned list of parameters.

* See Schedule "F".

SCHEDULE "E"

This Schedule "E" forms part of Provisional Certificate of Approval No. A 210103. *It describes the Landfill gas monitoring program referred to in Condition 15.*

E.1. OBJECTIVE

The objective of this program is to monitor combustible gas concentrations in the unsaturated zone along the southern buffer area boundary.

E.2. MONITORING PLAN

The Landfill gas monitoring program shall be carried out by City to address the stated objective and shall include:

E.2.1. Locations: GP1-93, GP2-93 and GP3-93

E.2.2 Monitoring Frequency: Twice per year in March and July

E.2.3. Types of Monitoring:

Measure and record gas levels. If groundwater is present within gas probes then purge and record groundwater level prior to recording gas levels the next day.

SCHEDULE "F"

This Schedule "F" forms part of Provisional Certificate of Approval No. A 210103. *It describes the list of parameters to be analyzed in leachate, groundwater and surface water samples referred to in Schedules B, C and D.*

GENERAL CHEMISTRY

A. Leachate
Hardness, Alkalinity, Chloride, Sulphate, TKN, BOD, COD, Ammonia - N, Fluoride, Phenols, Suspended Solids, Field pH, Field Conductivity, and Field Temperature.

B. Groundwater and Surface Water
Alkalinity, Chloride, TKN, Ammonia - N, Field pH, Field Conductivity, and Field Temperature.

METALS AND CYANIDE

A. Leachate
Aluminum, Arsenic, Barium, Calcium, Copper, Iron, Lead, Magnesium, Manganese, Potassium, Sodium, Strontium, Total Phosphorus, Cadmium, Chromium, Tin, Zinc.

B. Groundwater and Surface Water
Potassium, Sodium

VOCs

Benzene, 1,4-Dichlorobenzene, Toluene, Chlorobenzene.

BNAEs

Bis (2-ethylhexyl) Phthalate

OIL AND GREASE

Mineral oil and grease, animal/vegetation oil and grease.

BACTERIA

Total coliforms, Fecal coliforms, Fecal streptococci, E.coli.

In accordance with Section 139 of the Environmental Protection Act, R.S.O. 1990 c. E-19, you may by written notice served upon me and the Environmental Appeal Board within 15 days after receipt of this Notice, require a hearing by the Board. Section 142 of the Environmental Protection Act, as amended provides that the Notice requiring a hearing shall state:

1. *The portions of the approval or each term or condition in the approval in respect of which the hearing is required, and;*
2. *The grounds on which you intend to rely at the hearing in relation to <u>each</u> portion appealed.*

In addition to these legal requirements, the Notice should also include:

3. *The name of the appellant;*
4. *The address of the appellant;*
5. *The Certificate of Approval number;*
6. *The date of the Certificate of Approval;*
7. *The name of the Director;*
8. *The municipality within which the waste disposal site is located;*

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary,
Environmental Appeal Board,
112 St. Clair Avenue West,
Suite 502,
Toronto, Ontario,
M4V 1N3

<u>AND</u>

The Director,
Section 39, Environmental Protection Act,
Ministry of the Environment and Energy,
250 Davisville Avenue, 3rd Floor,
Toronto, Ontario.

NOTICE

TO:

The Corporation of the
City of Burlington
P.O. Box 5013
426 Brant Street
Burlington, Ontario L7R 3Z6

ATTENTION: MS. HELEN MACRAE, CLERK

Take Notice that condition no. 1 of Provisional Certificate of Approval No. A 210103, dated October 11, 1973, is hereby revoked and replaced with the following conditions:

1. Prior to the excavation of any waste in connection with the construction of a leachate collection system approved under Certificate of Approval No. 3-0819-86-007, the City shall file with the Director of Central Region of the Ministry of the Environment (the Regional Director) plans and design details for the relocating and covering of the excavated waste and the recontouring of the site. No waste may be excavated or relocated without the approval of the Regional Director and except in accordance with such plans and design details.

2. All excavated waste shall be handled in accordance with the "Health and Safety Protocol" described in a letter from Greg Ferraro, P. Eng. of Conestoga-Rovers & Associates Limited, to Lyle Parsons of the Ministry dated July 14, 1986.

3. Surface improvements shall be completed in accordance with Section 8.0 of the "Detailed Design Report, Leachate Collection System and Surface Drainage Improvements" dated June 1986 and the "Contract Documents for Surface Drainage Improvements" and associated Plans 1 to 4 issued June 20, 1986.

4. The City shall carry out the monitoring and inspection program as approved by the Regional Director with such modifications as may be approved from time to time by the Regional Director. On or before March 1st of each year, the City shall file a report with the Regional Director containing an analysis and evaluation of the monitoring and inspection program for the previous year.

The reasons for the imposition of these conditions are as follows:

1. The reason for condition 1 is to ensure that the relocation of the waste is carried out in accordance with a defined protocol. Not doing so may create a nuisance and would not be in the public interest.

2. The reason for condition 2 is to protect the health and safety of persons involved in the relocation of the waste.

3. The reason for condition 3 is to reduce infiltration of surface water into the site, to eliminate exposed refuse which is creating a nuisance and to ensure proper control of the site.

4. The reason for condition 4 is to provide for the investigation of groundwater contamination in the area of the site and to ensure that the existing surface water contamination problem is abated by the installation of the leachate collection system.

You may by written notice served upon me and the Environmental Appeal Board within 15 days after receipt of this Notice, require a hearing by the Board.

This Notice should be served upon:

Mr. Peter Hayes, B. Sc.
Conestoga-Rovers & Associates Limited
651 Colby Drive
Waterloo, Ontario
N2V 1C2

Dear Mr. Hayes:

Re: Environmental Performance Report, Bayview Park Landfill November 1994, Conestoga Rowers & Associates, for the City of Burlington and Jannok Ltd.

The above referenced report provides a technical evaluation as to the suitability of development of adjacent lands south of the landfill. The report is a follow up of a joint City of Burlington/Jannock Ltd. report "Concept proposal, Bayview Park Landfill Buffer Zone/Monitoring requirements and development of lands south of Bayview Park landfill dated January 1993 prepared jointly by CRA and Golders. Based on a review of monitoring and landfill performance data, the report documents the rationale for a revised monitoring program as well as the requirements for down gradient buffer/attenuation lands. Review comments are as follows:

1. Section 2.1, page 12. Landfill gas monitoring should be included in the current (1994) monitoring schedule.

2. Section 3.0. Field study methodology, instrumentation and sampling QA/QC generally conform to accepted hydrogeological practices.

3. Landfill leachate characterization is discussed under Section 4.3. Representative landfill leachate composition is based on chemical analysis taken from leachate wells and the collection system. Volatile organics most frequently detected in leachate are chlororbenzene, 1,4 - Dichlorobenzene, benzene and toluene. Chlorinated volatile organics could be considered as useful landfill leachate indicators in determining landfill impacts on ground

0781CF (06/94)
0781 CFA (10/93)

100% Unbleached Post-Consumer Stock
100% Unbleached Post-Consumer Stock

water because of the natural poor quality of underlying ground water and difficulty in finding suitable inorganic indicator paramaters.

4.Section 4.4.2.1. Water quality results from the 1993 series of observation wells is discussed, these monitors are screened and positioned in the active shallow flow system down gradient of the landfill. Chloride concentration from two sampling events in March and April are used to establish natural background quality and to assess the effectiveness of the leachate collection system in containing leachate contaminated ground water. Presently, there does not appear to be sufficient data to state that there is no deleterious ground water impact and that the collection system is effectively controlling migration of contaminated ground water within the proposed buffer/attenuation zone. Chloride concentration of 1150 to 936 mg/l in OW1B-93 suggest mixing with deeper seated mineralized water. To determine chloride concentration profiles and to assess natural water quality in shallow downgradient wells,the existing data base will need to be expanded.
The report recommends that sodium and potassium be included in the list of chemical paramaters to be tested in the proposed rationalized monitoring program. These values are to be used in trilinear plots of major ion ratios to assist in identifying apparent mixing of landfill leachate with ground and surface waters. There is no description of the method that will be used. Will the plotted data distinguish between leachate impacted ground water and shallow ground water mixed with deeper seated mineralised water.

The significance of low levels of benzene, ethyl benzene, xylene and toluene in the March sampling event is of some concern. Although BTEX compounds are known to occur naturally in some bedrock waters, additional work is required to show that the presence of these compounds is not landfill related.

5.Section 7.0. The buffer/attenuation zone area is shown in Drawing 1 and Figure 3.1. this area will be used for ground and surface water and landfill gas monitoring.The rationalized monitoring program is designed to measure ground water quality changes at the downgradient buffer zone boundary.The report states that the buffer/attenuation zone will allow for the attenuation of landfill derived contaminants and provide for boundary impact monitoring capabilities, in addition the buffer area would facilitate assess to the landfill collection system and provide land for contingency measures if required.While agreeing that the buffer zone will meet these requirements it is not clearly demonstrated that landfill derived impacts are completely eliminated in the buffer zone area. Further, what is the criteria to be used at the downgradient buffer boundary to establish water quality changes?

To summarise, the rationalized monitoring program for ground water outlined on Table 8.1 is generally acceptable. It must be recognised,that the current monitoring program is in its early stages and additional work is required to estimate background values and establish concentration trends. Modifications to the program may be necessary at some later date as the data base is expanded.Comments on the revised surface water monitoring are being addressed separately.

If you need clarification on the above, please call me at (905)815-5931.

Yours truly,

T. Brankovic, P. Eng.,
District Engineer
Halton-Peel Region

Reference No. 1354

Mr. Tom Brankovic
Ministry of Environment and Energy
Halton-Peel District Office
1235 Trafalgar Road, Suite 401
Oakville, Ontario
L6H 3P1

Dear Mr. Brankovic:

Re: Response to MOEE Comments
Environmental Performance Report
Bayview Park Landfill
City of Burlington, Ontario

Comments prepared by the MOEE regarding the groundwater component of the above-noted report are outlined in a letter to Mr. Peter Hayes dated February 22, 1995. Comments on the surface water monitoring were not included in this letter and will be addressed separately. A copy of the MOEE letter is included in Attachment A of this letter for ease of reference.

This letter provides CRA's responses to the MOEE Comments on a point-by-point basis:

1. MOEE Comment: Section 2.1, page 12

Landfill gas monitoring should be included in the current (1994) monitoring schedule.

CRA Response

The 1994 monitoring (Appendix B) schedule did not incorporate monitoring of landfill gas, as this was intended to be incorporated once, MOEE concurrence was received with respect to the rationalized monitoring program. As indicated in page 38 of the Environmental Performance Report, landfill gas monitoring will be conducted two times annually at each of the three gas probes (GP1-93, GP2-93 and GP3-93) monitoring locations. Landfill gas monitoring will only be included as part of the current monitoring schedule, when the monitoring program (both surface water and groundwater) and the extent of the proposed Buffer/Attenuation zone as proposed with the Environmental Performance Report is approved by the

MOEE. It should be noted that there are currently no structures in the vicinity of these boundary gas probe locations.

2. MOEE Comment: Section 3.0

Field study methodology, instrumentation and sampling QA/QC generally conform to accepted hydrogeological practices.

CRA Response

We are in agreement, no response required.

3. MOEE Comment

Landfill leachate characterization is discussed under Section 4.3. Representative landfill leachate composition is based on chemical analysis taken from leachate wells and the collection system. Volatile organics most frequently detected in leachate are chlorobenzene, 1,4-Dichlorobenzene, benzene, and toluene. Chlorinated volatile organics could be considered as useful landfill leachate indicators in determining landfill impacts on ground water because of the natural poor quality of underlying groundwater and difficulty in finding suitable inorganic indicator parameters.

CRA Response

It was indicated on page 31 of the Environmental Performance Report that "the presence of chlorinated volatile organic compounds are also considered as diagnostic indicators of landfill derived groundwater impact".

Given the historic difficulty in the evaluation of inorganic parameters as indicators of landfill-derived impact on groundwater quality, trends in inorganic parameters (see Response to Comment #4) will be evaluated in conjunction with trends in chlorinated volatile organic and BTEX compounds to determine the potential impact of the landfill on groundwater quality.

4. MOEE Comment: Section 4.4.2.1

Water quality results from the 1993 series of observation wells is discussed, these monitors are screened and positioned in the active shallow flow system downgradient of the landfill. Chloride concentration from two sampling events in March and April are used to establish natural background quality and to assess the effectiveness of the leachate collection system in containing leachate contaminated ground water. Presently, there does not appear to be sufficient data to state that there is no deleterious ground water impact and that the collection system is effectively controlling migration of contaminated groundwater within the proposed buffer/attenuation zone. Chloride concentration of 1150 to 936 mg/L in OW1B-93 suggest mixing with deeper seated mineralized water. To determine chloride concentration profiles and to assess natural water quality in shallow downgradient wells, the existing database will need to be expanded.

The report recommends that sodium and potassium be included in the list of chemical parameters to be tested in the proposed rationalized monitoring program. These values are to be used in trilinear plots of major ion ratios to assist in identifying apparent mixing of landfill leachate with ground and surface waters. There is no description of the method that will be used. Will the plotted data distinguish between leachate impacted groundwater and shallow groundwater mixed with deeper seated mineralized water.

The significance of low levels of benzene, ethylbenzene, xylene and toluene in the March sampling event is of some concern. Although BTEX compounds are known to occur naturally in some bedrock waters, additional work is required to show that the presence of these compounds is not landfill related.

CRA Response

It is realized that the existing database will need to be expanded in order to assess natural water quality in shallow downgradient wells. It should also be noted that no single parameters or sampling events are or will be used to identify the potential impact of landfill-derived leachate on groundwater quality. Rather, an evaluation of all parameters (inorganic, BTEX and chlorinated volatile organic compounds) and trends in water quality will be

used to identify the potential impact of landfill-derived leachate in the quality of downgradient groundwater.

It was recommended in p. 37 of the Environmental Performance Report that sodium and potassium be included in the list of chemical parameters to prepare major ion ratio plots and not trilinear plots. It is proposed to plot potassium/sodium (K/Na) vs. chloride/alkalinity (Cl/Alk) ratios in order to identify apparent mixing of landfill leachate with ground and surface waters. The existing leachate characterization data provided in Table 4.1 of the Environmental Performance Report indicate that the leachate contains relatively high concentrations of chloride (3,230 mg/L) and alkalinity (3,370 mg/L). The leachate is also comprised of relatively high concentrations of potassium (137 mg/L) and sodium (371 mg/L). Based on the above data, the Cl/Alk and K/Na ratios for the leachate are on the order of 1 and 0.5, respectively. The existing groundwater general chemistry data presented in Table 3.7A of the Environmental Performance Report indicates that the Cl/Alk ratios for shallow groundwater are different than the Cl/Alk ratio of 1 for leachate. The Cl/Alk ratios for shallow groundwater are generally less than 0.5. The ratios for deep mineralized or mixed shallow and deep mineralized groundwater are 5 or greater.

The potassium and sodium data will be used to determine the K/Na ratios for groundwater and these in turn will be employed to further assess if potential mixing of landfill leachate and groundwater occurs.

As indicated in the Environmental Performance Report, the emphasis will be placed on the evaluation of trends rather than single occurrences/detections in the ground and surface water quality.

The significance of low levels of BTEX compounds will be further evaluated as additional groundwater quality is obtained. Again, emphasis will be placed on the evaluation of trends in water quality (i.e., BTEX, chlorinated volatile organic compounds and inorganic parameters).

5. MOEE Comment: Section 7.0

The buffer/attenuation zone area is shown in Drawing 1 and Figure 3.1. This area will be used for ground and surface water and landfill gas monitoring.

The rationalized monitoring program is designed to measure groundwater quality changes at the downgradient buffer zone boundary. The report states that the buffer/attenuation zone will allow for the attenuation of landfill derived contaminants and provide for boundary impact monitoring capabilities, in addition the buffer area would facilitate assess to the landfill collection system and provide land for contingency measures if required. While agreeing that the buffer zone will meet these requirements it is not clearly demonstrated that landfill derived impacts are completely eliminated in the buffer zone area. Further, what is the criteria to be used at the downgradient buffer boundary to establish water quality changes?

CRA Response

The proposed buffer/attenuation zone is intended to allow for control for the purposes of monitoring and the implementation of any additional management practices that may be required. In addition, the criteria to be used at the downgradient buffer boundary to establish water quality changes will be based on the evaluation of trends in water quality for all parameters (i.e., BTEX, chlorinated volatile organic compounds and inorganic parameters).

6. MOEE Comment: Section 7.0

To summarize, the rationalized monitoring program for groundwater outlined in Table 8.1 is generally acceptable. It must be recognized, that the current monitoring program is in its early stages and additional work is required to estimate background values and establish concentration trends. Modifications to the program may be necessary at some later date as the database is expanded.

CRA Response

It is realized that the current monitoring program is in its early stages and that additional work is required to estimate background values and establish concentrations trends.

As previously indicated emphasis will be placed on the evaluation of trends in water quality rather than the evaluation of single occurrences of detections.

Modifications to the monitoring program will be performed if the evaluation of the expanded database indicates that this is necessary.

Both the City of Burlington and Jannock Ltd. would like to initiate the Proposed Site Monitoring Program Specifications (Table 8.1) as soon as practical. As stated on pg. 39 of the Environmental Performance Report; the proposed program will not be implemented until the MOEE has approved both, the complete monitoring program, and the limits of the Proposed Buffer/Attenuation zone. It is our understanding that a surface water MOEE reviewer has yet to review the Environmental Performance Report, your best efforts to expedite the review process would be appreciated. Also, please recall, that the COB would like initiate discussions with regards to any amendments to the Certificate of Approval which may be appropriate to reflect the legal definition of the site given the additions of downgradient buffer/attenuation zone lands.

Should you have any questions on this matter, please do not hesitate to contact us.

Yours truly,

CONESTOGA-ROVERS & ASSOCIATES

RE: Bayview Park Landfill, City of Burlington
CRA Letter Ref No. 1354, dated April 25, 1995

I have received and looked at Conestoga-Rovers & Associates reply to the MOEE comments in their letter report dated April 25, 1995.

CRA have satisfactorily addressed the concerns/questions raised in our review comments of the Environmental Performance report. As indicated in the CRA response, the emphasis in the environmental performance monitoring is on the evaluation of water quality trends rather than on single occurences or exceedences. It is also recognised that the existing data base needs to be upgraded and that additional work will be required to estimate background values and assess water quality changes.

I hope you find the above in order.

J. D'Cruz

Certificate of Approval (Sewage)
Certificat d'autorisation (eaux usées)

Number / *Numéro* 3-0819-86-007

Whereas / ***Attendu que*** THE CORPORATION OF THE CITY OF BURLINGTON

of / *d*

has applied in accordance with Section 24 of the Ontario Water Resources Act for approval of:
a fait, conformément à l'article 24 de la loi sur les ressources en eau de l'Ontario, une demande d'autorisation:

A new leachate collection, pumping and transmission system to collect and dispose of (into the City of Burlington's municipal sanitary sewer system) surface leachate and contaminated shallow groundwater from the closed Bayview Park sanitay landfill site bounded by King Road to the northeast and the upper reaches of Indian Creek to the southwest in the City of Burlington, consisting of a toe drain system located at the base of a ravine to the west of the landfill area running approximately 250 metres north of the landfill south property line, two pre-fabricated leachate collection sumps having twin (one duty and 1 standby), 1.5 and 2.0 kW explosion proof submersible type pumps, each pump being rated at:

Pump	Rated Head (m)	Rated Capacity (L/min)
2	17.4	225
3	19.9	200

together with all associated pump level controls, access hatch, electrical control panel internal sump piping, fittings and appurtenances as well as a 200 mm buried perforated PVC leachate collector header at each sump location and 50-75 mm diameter high density polyethylene collected leachate forcemains located along the south edge of the landfill fill area discharging to a 200 mm diameter leachate collection sewer and forcemain, the forcemain section of the sewer being located within the fill area of the landfill (southern edge) for a distance of 120 metres to a height of land with the gravity section of the leachate collection sewer continuing along the south side of the landfill to King Road a distance of 470 m. The sewer then turns south following the west ditch of King Road down to the North Service Road, a distance of approximately 590 metres. The gravity sewer then changes diameter to 450 mm and crosses under the North Service Road and Highway 403 at a point 20 m west of the King Road Overpass. The sewer crosses Highway 403 (a distance of 80 m) and then continues south for 127 metres on the west side of King Road to an existing 450 mm municipal sanitary sewer located on King Road, all in accordance with the documents listed in Schedule "A" (attached) at a total estimated cost, including engineering and contingencies, of EIGHT HUNDRED AND FIFTY THOUSAND DOLLARS ($850,000.00), subject to the following special terms and conditions considered necessary by the undersigned: ---------- 2

Now therefore this is to certify that after due enquiry the said proposed works have been approved under Section 24 of the Ontario Water Resources Act.

Le présent document *certifie qu'après vérification en bonne et due forme la construction dudit projet d'ouvrages a été approuvée aux termes de l'article 24 de la loi sur les ressources en eau de l'Ontario.*

This Certificate supercedes Certificate of Approval No. 3-0819-86-006 issued at Toronto, on June 27, 1986.

has applied in accordance with Section 24 of the Ontario Water Resources Act for approval of:
a fait, conformément à l'article 24 de la loi sur les ressources en eau de l'Ontario, une demande d'autorisation:

SPECIAL TERMS AND CONDITIONS

1. Upon completion of the sewage works the Corporation of the City of Burlington shall supply the Ministry of the Environment, Environmental Approvals and Land Use Planning Branch with as-constructed drawings for the on-site works namely those works between Manhole No. 12 and Manhole No. 21, including all works located within the Bayview Park Landfill site boundary as shown on the engineering drawing entitled Bayview Park Landfill Leachate Collection System, General Layout, Drawing No. 06, Sheet 1 of 15, prepared by Conestoga-Rovers & Associates Limited dated April, 1986 revised as per addendum No. 1 and Change Order No. 1.

2. All liquids which require dewatering for any reason during construction of all on-site works between Manhole No. 12 and Manhole No. 21 as described in Condition No. 1 shall be discharged to a sanitary sewer. Written records of volumes of liquids dewatered shall be supplied to the MOE inspector upon request.

SCHEDULE "A"

This Schedule "A" forms part of Certificate of Approval No. 3-0819-86-007 issued on July 16, 1986.

1. Detailed design drawings prepared by Conestoga-Rovers and Associates Limited, Consulting Engineers, issued June 23, 1986 and date stamped July 8, 1986 Environmental Approvals and Land Use Planning Branch entitled Bayview Park Landfill, Leachate Collection System, Contract No. 86-16.

2. Contract Specifications dated June, 1986 entitled City of Burlington, Bayview Landfill Site Leachate Collection System and Surface Drainage Improvements, Contract 86-16, File 760.04-2 (noted by MOE as a second submission).

3. A letter dated June 17, 1986 to Mr. Lyle Parsons from Greg Ferraro, P.Eng. entitled Addendum No. 1, Bayview Park Landfill, Leachate Collection System detailing changes to the Leachate Collection System, Contract 86-16.

4. A letter dated June 23, 1986 to Lyle Parsons, B.E.S. Systems Co-ordinator from Alan Ramsay, Environmental Management Co-ordinator, The Corporation of the City of Burlington, with attached Addendum No. 2, Bayview Park Landfill, Leachate Collection System detailing changes to the leachate pumping system, Contract 86-16.

5. Change Order No. 1 dated June 25, 1986 entitled Corporation of City of Burlington, Bayview Park Landfill, Leachate Collection System Contract 86-16, unsigned.

6. A letter dated June 26, 1986 to Mr. Lyle F. Parsons, B.E.S. Systems Co-ordinator from Greg Ferraro, P.Eng., entitled Change Order No. 1, City of Burlington, Bayview Park Landfill Leachate Collection Systems with attached Appendix A entitled PVC and HDPE Pipe Strength Calculations.

7. A letter dated July 4, 1986 to Mr. T. Armstrong, Acting Director Environmental Approvals and Land Use Planning Branch from Michael N. Boggs, Chief Administrative Officer entitled Bayview Park Landfill Site, Ontario Water Resources Act Application.

MEMORANDUM

To: Tom Brankovic
Oakville District Office

From: Ellen Schmarje

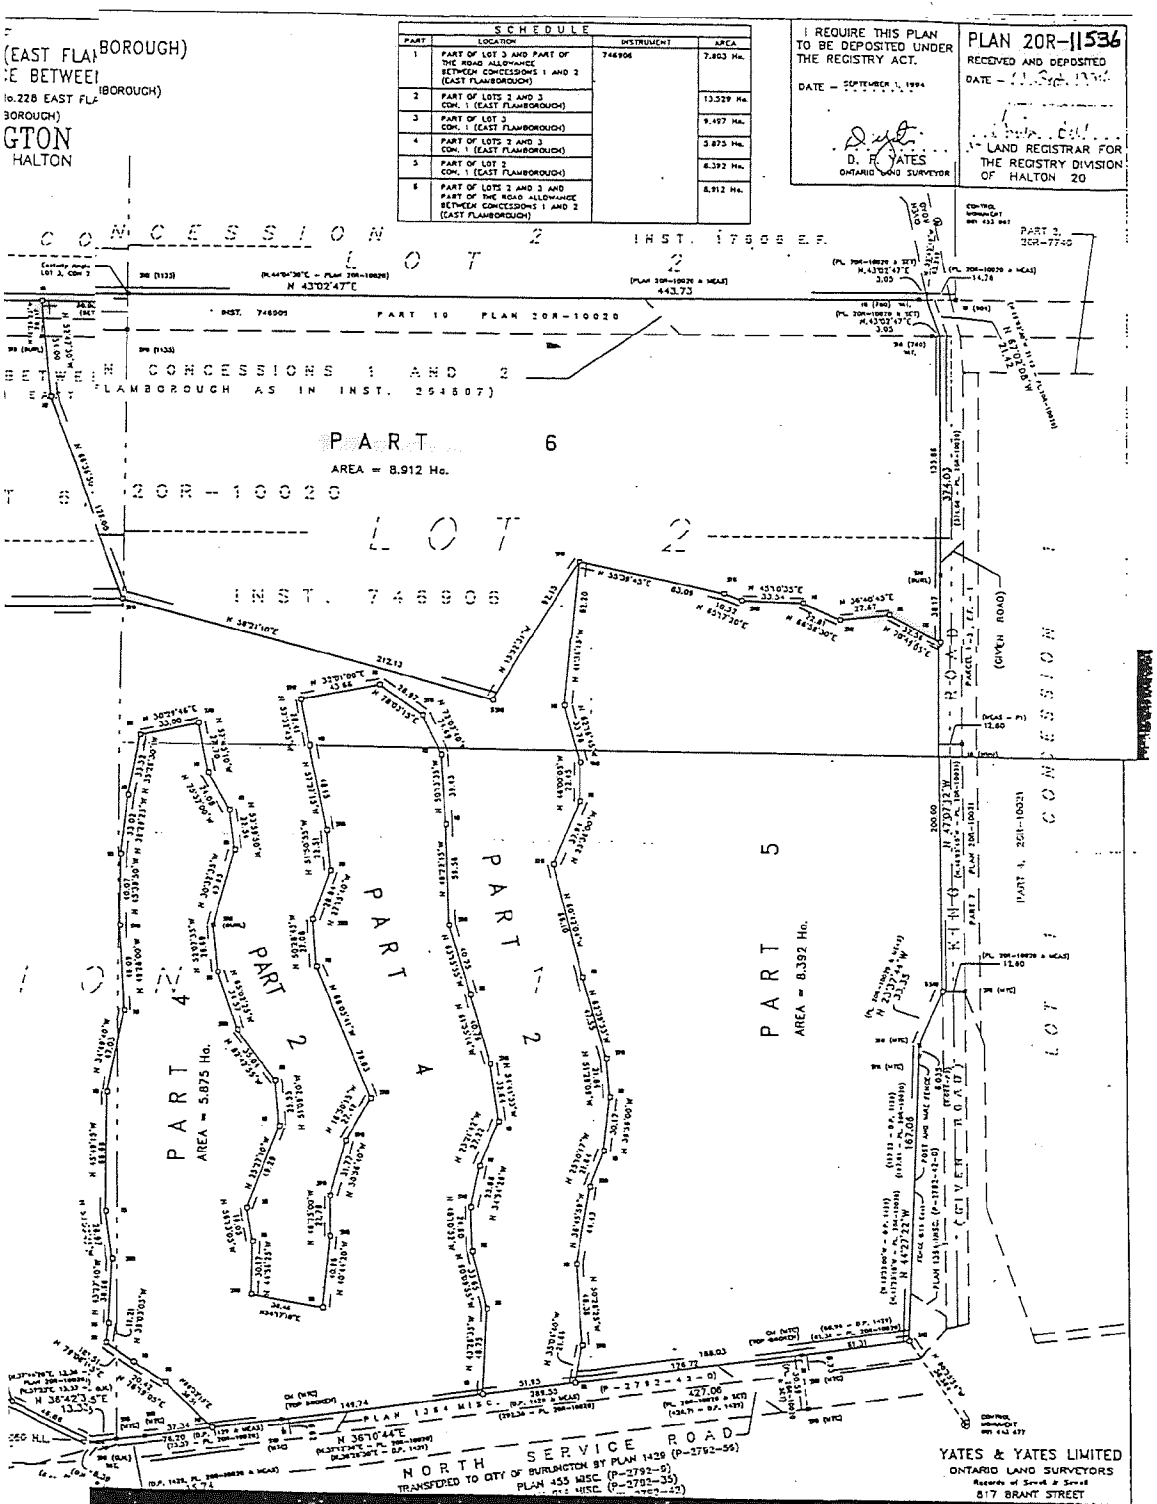
Re: Bayview Park Landfill Site
1994 Annual Status Report, March 1995
& Environmental Performance Report, Nov. 1994
Burlington, Ontario
File: WA450202, SW24-0205

I have reviewed both of the above reports with respect to surface water impacts.

The landfill does appear to be affecting the surface water quality at the monitoring locations adjacent to, or immediately downgradient of the landfill, as compared with upstream and downstream monitoring points. However, the impact appears to be minor at this time, and continued monitoring should confirm this and detect any worsening.

The revised monitoring locations proposed in the Environmental Performance Report appear appropriate to monitor any changes in surface water quality.

Since it is proposed that the revised monitoring program be conducted only twice per year, if stations are dry on both occasions, then a third sampling run should be attempted in the fall.



The leachate should continue to be analyzed for phenols and toluene (if not already included in the parameter list). If either of these parameters are detected in consecutive samples, they should be added to the surface water monitoring program.

To summarize, the rationalized surface water monitoring program is generally acceptable, with the above conditions. Modifications to the program may be required at a later date.

If you have any questions regarding the above, please don't hesitate to call me.

TABLE 8.1 [REVISED]

SITE MONITORING SPECIFICATION
ENVIRONMENTAL PERFORMANCE REPORT
BAYVIEW PARK LANDFILL

1.0 SURFACE WATER MONITORING

1.1 Locations: 8 Surface water;

Upstream:	SW9A-93, SW11-87
Landfill Vicinity:	SW1-87, SW3-87, SW5-87
Downstream:	SW13-93, SW14-93, SW15-93

1.2 Monitoring Frequency:

Semiannually: March, (wet weather sampling)
July (dry weather sampling)
if both events are dry, a third event is to be scheduled in the fall

1.3 Types of Monitoring

1. measure flow rate accurately at SW9A-93, SW13-93, SW14-93 and SW15 -93 location using flow meter and record as L/sec or gpm

2. sampling:

VOCs	EPA List 624 + xylenes
General Chemistry	field pH, field conductivity, field temperature, alkalinity, chloride, sodium, potassium, TKN, ammonia-N,
	if phenols are detected in the leachate during two consecutive events, then phenols are to be added
Bacteria	total coliforms, fecal coliforms, fecal streptococci and E.coli

OK!

TABLE 8.1 [REVISED]

SITE MONITORING SPECIFICATION
ENVIRONMENTAL PERFORMANCE REPORT
BAYVIEW PARK LANDFILL

2.0 GROUNDWATER MONITORING

2.1 LOCATIONS

7 Buffer Zone Observation Wells	PW3, OW1A-93, OW1B-93, OW2A-93, OW2B-93, OW3-93, OW4-93

2.2 Monitoring Frequency:

March and **July**

2.3 Types of Monitoring

i) measure well depth and water level at each well

ii) all observations well locations purged at least 10 well casing volumes or dry prior to sampling.

- sample PW3, OW1B-93, OW2A-93, OW2B-93, OW3-93 and OW4-93, after purging, for both VOCs and general chemistry

iii) Sampling:

General Chemistry	field pH, field conductivity, alkalinity, TKN, ammonia-N, chloride, sodium, potassium
VOCs	EPA List 624 + xylenes (above six locations only)

3.0 LEACHATE WELL MONITORING

3.1 Location: 6 Leachate Wells LW1, LW2, LW3, LW4, LW5, LW6

3.2 Monitoring Frequency:

Twice per year: **March** and **July**

3.3 Types of Monitoring

TABLE 8.1 [REVISED]

SITE MONITORING SPECIFICATION
ENVIRONMENTAL PERFORMANCE REPORT
BAYVIEW PARK LANDFILL

1. measure depth with plopper (sound) each leachate well

2. monitor and record leachate level in each well

4.0 LEACHATE COLLECTION SYSTEM MONITORING

4.1 Location: 1 Manhole MH15

4.2 Monitoring Frequency:

Once per year for **leachate quality at MH15**: March

4.3 Types of Monitoring

i) Sampling (at MH15):

General chemistry	see attached parameter list, includes Field pH, Field Conductivity, Field Temperature
Metals & Cyanide	
VOCs	
BNAEs	
Oil and Grease	

TABLE 8.1 [REVISED]

SITE MONITORING SPECIFICATION
ENVIRONMENTAL PERFORMANCE REPORT
BAYVIEW PARK LANDFILL

5.0 LANDFILL GAS MONITORING

5.1 Locations: GP1-93, GP2-93 and GP3-93

5.1.1 Monitoring Frequency

Twice per year: **March** and **July**

5.1.2 Types of Monitoring

Measure and record gas levels. If groundwater is present within gas probes purge and then record groundwater level prior to recording gas levels the next day.

6.0 LEACHATE SEEP AND LEACHATE COLLECTION SYSTEM INSPECTION

6.1 Locations: 9 Leachate Seeps LS1, LS2, LS3, LS4, LS5, LS6, LS7, LS8, LS9

6.2 Monitoring Frequency:

Twice per year: **March** and **July**

6.3 Types of Monitoring:

i) Identify and photograph any leachate seep that has re-occurred
ii) Estimate flow rate at the seep and report as L/sec or gpm
iii) Complete leachate seep inspection sheets
iv) Report any occurrences of leachate seeps or failure of leachate collection system.
v) It is noted that regular leachate inspections will also be conducted by City of Burlington staff. These reports will be documented and discussed in the annual monitoring report.

Application for Approval of a Waste Disposal Site

FOR OFFICE USE ONLY				
Application Number(s)	Client Number	Payment Received	Date	Initials
210103		$	12/22/95	

Ce formulaire est disponible en français

Information requested by this form is collected under the authority of the *Environmental Protection Act*, R.S.O. 1990 (EPA), Chapter E-19, (EPA) and the *Environmental Bill of Rights*, c.28, Statutes of Ontario, 1993, (EBR) and will be used to evaluate applications for approval of waste disposal sites according to the requirements of the EPA. Questions should be directed to the Approvals Branch, 250 Davisville Avenue, 3rd Floor, Toronto, Ontario, M4S 1H2, Telephone No. (416)440-3713 or 1-800-461-6290, or to your local Ministry of Environment and Energy District Office.

Instructions

1. When completing this form, please refer to the "Guide For Applying for Approval of Waste Disposal Sites", Sections 27, 30, 31 and 32, EPA (referred to as the Guide).

2. This form must be completed with respect to all the requirements of the Guide in order for it to be considered as an application for approval. INCOMPLETE APPLICATIONS WILL BE RETURNED TO THE APPLICANT OR DENIED APPROVAL.

3. A complete application for approval consists of;
   (1) a completed and signed application form;
   (2) all supporting information as requested by this form and by the Guide; and
   (3) a certified cheque or money order for the approval fee, if applicable.
   The Ministry may require additional information following a review of the complete application.

4. Two (2) copies of the application together with the supporting information must be submitted to the Ministry of Environment and Energy,
   One copy to: Director of Approvals Branch, Ministry of Environment and Energy,
   250 Davisville Avenue, 3rd Floor, Toronto, Ontario, M4S 1H2

   OR

   Regional Director in the region in which the site is located/will be located

   A duplicate copy must be sent to the District Office having jurisdiction over the area in which the works will be located.

5. Information contained in this application is not considered confidential and will be made available to the public upon request. Certain information submitted as supporting information may be claimed as confidential but will be subject to the *Freedom of Information and Protection of Privacy Act* (FOIPOPA) and EBR. If you do not claim confidentiality at the time of submitting the information, the Ministry may make the information available to the public without further notice to you.

6. PROJECT/APPLICATION DESCRIPTION – EBR Abstract (Brief description of the proposal)

The Bayview Park Landfill Site was closed in 1973 and has since been operated as a park facility. A leachate collection system which collects surface leachate flows and impacted shallow groundwater for discharge to the Regional Municipality of Halton sanitary sewer system was subsequently constructed and has operated since 1986. Downgradient lands adjacent to the Bayview Park Site, on which the leachate collection system is situated is being purchased by the City of Burlington as buffer lands, from Jannock Properties. Lands to be purchased are shown on attached site plan (reference Item 8) and survey plans (reference Item 9 and 10). Note: A small "tailpiece" portion of land that was originally proposed to be part of the proposed buffer zone in November 1994 is not included. These lands represent a road access for the Jannock property. The buffer zone as now outlined will provide for the purposes set forth in the Environmental Performance Report Section 7.0.

7. EBR REQUIREMENTS

Is this a Prescribed Instrument under EBR?	[X] Yes, Class of Instrument? II	[ ] No
If a Prescribed Instrument, is it excepted from public notification?	[X] Yes	[ ] No
If it is excepted from EBR, provide reason	[ ] Emergency	[ ] Equivalent Public Participation
	[ ] EAA or Tribunal Decision	[X] Environmentally Insignificant amendment or revocation

If exempt from public notification, documentation in support of the noted exception must be provided.

8. PUBLIC CONSULTATION/NOTIFICATION– Specify all public consultations/notification (such as public meetings, notification of First Nations etc.) that has been completed or is in the process of being completed.

See attached letters and Memorandum from MOEE and CRA dated February 22, 1995(Ref 3)
April 25, 1995 (Ref 4)
June 21, 1995 (Ref 5)
Sept 15, 1995 (Ref 6)

9. OTHER APPROVALS/PERMITS – List all other environmental approvals/permits applied for related to this project or received under the EPA (discharges to air, waste management, sewage systems, etc.) and the Ontario Water Resources Act (OWRA) (water works, permit to take water, etc.).

Certificate of Approval for Industrial Sewage Works 3-0819-86-007 (attached Ref 7)

10. PROJECT SCHEDULE

Estimated Date for Start of Construction	Estimated Date for Start of Operation

11. FEE ESTIMATE – The "cost" to used to estimate the fee includes all equipment and construction costs but does not include costs for land, engineering services and costs of facilities for which the permit or approval is applied for under other Sections of the EPA or the OWRA for which appropriate fees have or will be paid. The fee shall not be less than $50.00 or more than $100,000.00. (For more information refer to the Guide)

(1) The fee payable upon submission of an application under Section 27 or the EPA where the application relates to a waste disposal site other than a landfilling site is:

(a) 2% of the cost of the equipment and construction related to the application, less

(b) an amount equal to the proportion of the waste that is received at the site and will leave the site for recycling or reuse to the total amount of waste received at the site, calculated by weight or by volume, multiplied by the amount referred to in clause (a).

(c) where additional approvals are required under other Sections of the Act, separate fees are also required.

(2) For the purpose of clause 1 (a), recycled or reused waste does not include waste intended to be used as a dust suppressant or as a fuel or intended to be disposed of at a landfilling site or incinerator.

(3) The fee payable upon application under Section 27 of the EPA where the application relates to a landfilling site is 4 cents per cubic metre of the capacity of the landfilling site.

Estimated Fee ($50.00 minimum, $100,000.00 maximum) $ 50.00 Cheque or Money Order Attached [X] Yes [ ] No

When an application is submitted to the Ministry for review the fee must be in the form of a certified cheque or money order payable to "The Minister of Finance".

DO NOT SEND CASH

12. SUPPORTING INFORMATION CHECKLIST – This is a list of all supporting information attached to this application and is subject to the FOIPOPA and EBR.

Dear Mr. Zaltsberg:

Re: Application to Amend the Certificate of Approval for the Bayview Park Landfill
Burlington, Ontario

In response to your letter of January 17, 1996, Conestoga-Rovers & Associates (CRA) prepares the following response to your concerns regarding the above-noted Certificate of Approval (C of A) application submitted on December 7, 1995 by the City of Burlington (COB).

MOEE Comment #1

What is the current status of the proposed buffer/attenuation zone? Did the COB acquire this zone and if so, when? Did the COB obtain groundwater rights within this property and if so, when?

CRA Response #1

There is an agreement to purchase the buffer/attenuation zone between the COB and Jannock. Further to recent communication between CRA and COB, it is understood that there are three minor outstanding conditions to be dealt with prior to formal completion of the buffer/attenuation zone acquisition. These are:

(a) consents for dismissal of previous actions;
(b) releases specifically relating to the past actions; and
(c) that both parties will agree to provide a warning clause in the subdivision agreement, which largely relates to the fact that the Subject lands are adjacent to the closed Bayview Park Landfill Site.

It is anticipated the property transaction will be formerly completed by the end of March 1996. The COB as owner of the subject lands will obtain groundwater rights within the buffer/attenuation zone when the property transfer is complete.

MOEE Comment #2

What is the current status of wells OW1A, 1B-93 and OW2A, 2B-93 referred to on page 34 of the Environmental Performance report?

CRA Response #2

The above noted monitoring well nests, as well as monitoring wells OW3-93 and OW4-93 have been installed within the buffer/attenuation zone, and along with well PW-3 are proposed to replace the current groundwater monitoring network in-place at the Site. It is also proposed to abandon the monitoring wells which comprise the current monitoring network.

The monitoring specifications involving these seven monitoring wells are outlined within Reference Item #13. This monitoring program will be implemented beginning in April 1996.

MOEE Comment #3

There are some minor discrepancies in the shape of the northwestern segment of the proposed buffer/attenuation zone shown on Figure 3-1, Drawing N1 dated May 1993 from the report, Drawing N1 (Reference Item 8) dated November, 1995 and Plans 20R-11536, 11537 (Reference Items 9 and 10). Which area is correct and correspond to the 11.23 ha area referred to in the application?

CRA Response #3

As outlined in Section 6 of the C of A Application dated December 7, 1995, the small portion of land causing the discrepancy was originally proposed to be part of the buffer/attenuation zone on Figure 3.1/Drawing No. 1 within the Environmental Performance Report in November 1994 (Reference Item #11). However, these lands represent an access road for the Jannock property and as such, will remain in Jannock's control.

A close examination of an updated version of the above noted Drawing (Reference Item #8), indicates this land as being previously proposed as part of the buffer/attenuation zone, and is to remain in Jannock's control. Therefore Drawing No. 1 dated November 1995 (Reference Item #8) supercedes Drawing No. 1 dated November 1994 (within Reference Item #11). Reference Item #8 also agrees with Reference Items #9 and #10, and therefore accurately represents the total 11.23ha area referred to within the C of A Application.

MOEE Comment #4

Do you want to incorporate the proposed buffer/attenuation zone into the new Site boundary?

CRA Response #4

Yes, the intent of the application for amendment to the C of A is to have the Site property boundaries modified to reflect the acquisition of the buffer/attenuation zone by the COB.

CRA trusts that the above clarifications will be sufficient to allow for the processing of the C of A Application to proceed once the property transaction is completed. We will inform you when this occurs and provide you with appropriate documentation to that effect. As discussed, once the property transaction is complete the MOEE will then proceed with the processing of the application. Should you have any further questions or concerns, please contact our office.

Yours truly,

CONESTOGA-ROVERS & ASSOCIATES

Dear Mr. Zaltsberg:

Re: Application to Amend the Certificate
of Approval for the Bayview Park Landfill
Burlington, Ontario

As per our recent telephone conversation, please find enclosed a revised project description to replace the description included in Section 6 of the original C of A application dated December 7, 1995. This description has been prepared as per your request for use as part of the EBR Bulletin Board posting.

> *The Bayview Park Landfill Site was closed in 1973, and has since been operated as a park facility by the City of Burlington. A leachate collection system which collects impacted shallow groundwater for discharge to the Regional Municipality of Halton sanitary sewer system was subsequently constructed and has operated since 1986 under the appropriate Certificate of Approval for Industrial Sewage works. Downgradient lands adjacent to the Bayview Park Site, on which the leachate collection system is situated are being purchased by the City of Burlington for use as buffer lands. A network of seven monitoring wells have been installed within the buffer lands, and will be monitored semi-annually for general chemistry and VOC analytical parameters, to quantify that no adverse impacts on the groundwater regime are occurring. A total of eight upstream, landfill vicinity, and downstream surface water monitoring locations are also included as part of the semi-annual monitoring network. Surface water samples will also be analyzed for general chemistry and VOC analytical parameters, as well as for bacteria.*

CRA trusts that the above is satisfactory, and will be amended to the original application. As discussed in our letter dated January 31, 1996, CRA will inform you

when the property transaction is complete, at which point the MOEE will proceed with the processing of the application.

Should you have any further questions or concerns, please contact our office.

Dear Mr. Zaltsberg:

Re: The December 7, 1995 Application to Amend the Certificate of Approval #A.2102.05
Bayview Park Landfill
Burlington, Ontario

Conestoga-Rovers & Associates (CRA) is pleased to forward to yourself a copy of the Transfer of Land Certificate for the buffer lands surrounding the Bayview Park Landfill Site. The City of Burlington (COB) now owns the subject buffer lands.

As per your letter of February 12, 1996, as the COB now owns the buffer lands, CRA would appreciate your timely attention to forwarding the application along with the updated EBR abstract dated February 6, 1996 to the EBR office.

Should you have any further questions or concerns, please contact our office.

Yours truly,

CONESTOGA-ROVERS & ASSOCIATES

Attention: Mr. Peter Hayes

Dear sir:

Subject: City purchase from 873805 Ontario Inc.
PART 1, 20R-11537 and PART 6, 20R-11536
Our file: 575-03-N.27

We are pleased to advise the Transfer of Land in connection with the above was registered April 18, 1996 as Instrument No. 850935 and we enclose a copy for your records.

This now completes the City's obligation under the Minutes of Settlement to acquire the buffer strip lands and the MOEE may now proceed to complete the Certificate of Approval required for this property.

Thank you.

Yours truly,

Tami A. Price (Mrs.)

1.0 INTRODUCTION

1.1 Project Background

Golder Associates Ltd. was retained by Jannock Properties aannock) to conduct an environmental study of Jannock's proposed development lands in Burlington, Ontario. The study would address the requirements of Policy 07-07 of the Ministry of the Environment and Energy (MOEE) for development near landfills.

The subject lands are located on the west side of King Road, north of the North Service Road and Highway 403 (Figure 1). They are bounded to the west by the former Halton Regional Landfill (also known as the Burlington Landfill) which was closed in 1988, and to the north by Jannock's licensed quarry area and by the former Bayview Park Landfill which was closed in 1972. The subject property is approximately 45 hectares in size. A site plan is shown in Figure 2. The subject lands are currently zoned "D" development under By-Law 4000-3 of the City of Burlington and as a Special Complementary Use Area under the Parkway West Belt Plan. Jannock Brick intends to develop the lands as Prestige Industrial, in conformity with the Parkway West Belt Plan. The development would consist of fully serviced slab-on-grade buildings. It is our understanding that no groundwater extraction will be undertaken, and the buildings will be located so as to prevent impacts to surface water bodies (primarily intermittent streams) in the area. In addition, a proposed buffer/attenuation zone southeast of the Bayview Park landfill has been proposed to allow the City of Burlington unrestricted access to monitor and repair the leachate collection system at the landfill, and to allow for a contingent contaminant attenuation zone. Groundwater and gas monitoring down-gradient from the landfill will also be monitored. Please note that under the requirements of MOEE Policy 07-07 a 30 m peripheral area buffer zone is required from the limit of the landfill material. The proposed buffer/attenuation zone boundary outlined herein is greater than this 30 m setback. Establishment of the proposed buffer/attenuation and the proposed buffer/attenuation zone boundary would be subject to a land transfer between the City of Burlington and Jannock Properties.

The Jannock land holdings include a licenced quarry area located north of the proposed development lands. It is Jannock's intention to conduct full-scale shale extraction activities in the licenced quarry area; however, these activities are not planned in the near future. Jannock is currently pursuing the development of the southern portion of their land holdings that front along the North Service Road and King Road.

Previously, these lands and the licenced quarry area were the subject of a comprehensive environmental assessment conducted by the Regional Municipality of Halton. The purpose of that assessment was to determine if the subject lands would be suitable for landfilling activities. The property, referred to as "Site F", was not selected for the landfill site.

In February, 1993, Golder Associates prepared a Conceptual Work Program to assess the potential for the groundwater, surface water and subsurface soils of the site to have been, or to be, impacted by methane gas or leachate discharges from the former Halton Regional Landfill (Golder Associates Ltd. reference No. 911-1602). As well, in January, 1993, a separate work plan was prepared jointly by Golder Associates and Conestoga Rovers and Associates Ltd. (CRA) to assess the hydrogeological and soil gas conditions down-gradient of the Bayview Park Landfill.

This report contains the results of both work programs to date, and assesses the results with respect to MOEE policy 07-07 as it relates to potential groundwater, surface water and gas impacts from the former landfills on the proposed development.

1.2 Halton Regional Landfill

The Halton Regional Landfill, also known as the Burlington Landfill, operated as a municipal solid waste landfill until site closure in December, 1988. A final cover of clay soil was installed over the landfill after closure. The northern part of the landfill is equipped with an underdrain leachate collection system, which drains to a perforated pipe perimeter toe drain. The southern part of the landfill, which is older, was retro-fitted with a perforated pipe perimeter toe drain after the emplacement of refuse.

A monitoring program has been conducted at the landfill since 1978. Currently, monitoring is carried out on behalf of the Regional Municipality of Halton as a requirement of the landfill Certificate of Approval. The current program includes groundwater level measurements, groundwater sampling and analysis, measurement of surface water flows, surface water sampling and analysis, and sampling of leachate from a manhole in the leachate collection toe drain.

1.3 Bayview Park Landfill

The Bayview Park Landfill was operated as a municipal solid waste landfill by the City of Burlington from 1957 until site closure in 1972. A clay soil cover was installed over the landfill

after closure. A leachate collection system, consisting of perforated pipe collectors and french drains, was installed at the perimeter and into the side slopes of the landfill in 1986 and 1987. The site is currently operated as a park facility.

A monitoring program has been conducted at the landfill on behalf of the City of Burlington since 1986, as a requirement of the landfill Certificate of Approval. The current program includes groundwater level measurements, groundwater sampling and analysis, measurement of surface water flows, surface water sampling and analysis, and measurement of leachate levels and sampling of leachate from 6 wells installed into the refuse.

2.0 SITE GEOLOGY AND HYDROGEOLOGY

2.1 Site Geology and Surface Drainage

The following information on site geology has been taken from a number of previously reported studies on the site and the Bayview Park and Halton Regional landfills, (eg. CRA, 1993; Henderson Paddon Environmental, 1993) as well as information gathered during field investigations performed by Golder Associates and CRA as part of this study.

The Jannock development lands are located below the lower slopes of the Niagara Escarpment in an area heavily dissected by gullies and ravines. The site area generally slopes to the southeast, toward Lake Ontario. The site lies within the drainage areas of two creeks which eventually drain to Lake Ontario. Most of the site lies within the Indian Creek watershed, but a small area in the southwest portion of the site lies within the Falcon Creek watershed. The on site tributaries to these watersheds are small, intermittent streams which generally flow in response to surface water runoff. The base flow (groundwater) component of these streams appears to be small.

Much of the Jannock development site is underlain by a reddish brown, clayey silt to clay till. The till is generally several metres thick, and is reported to be up to 8 metres thick at some locations on-site. The till appears to be absent near the western site boundary adjacent to the Halton Regional Landfill. Bedrock underlying the till is a red to green shale of the Queenston formation. The upper portion of this shale is generally soft, and highly weathered and fractured. Under the site, this "mantle" of weathered shale varies in thickness from 0 to over 6 metres. Underlying the weathered shale mantle is a less fractured shale. The fracture patterns within the weathered shale mantle and shale show considerable variation both vertically and laterally over the site area.

2.2 Site Hydrogeology

Previous investigations have identified two primary hydrogeological flow systems in the site area. The shallow or active groundwater flow system occurs primarily in the upper, heavily fractured shale. Groundwater in this system is characterized by relatively low chloride concentrations (generally less than 2,000 mg/L). The pattern of groundwater flow in this system generally follows topography and the overall flow direction is from northwest to southeast, with some local

discharge of groundwater into creeks. Groundwater "mounds" occur within both the former landfills adjacent to the site, causing some shallow groundwater flow to be directed radially outward from the southern portions of both landfills. Thus shallow groundwater flow from both landfills is directed towards the site.

The underlying deep groundwater flow system is characterized by strong downward hydraulic gradients and saline groundwaters. Chloride and hardness levels in this system commonly exceed 10,000 mg/L, and have been reported to be over 50,000 mg/L in some samples. While the permeability of both the upper, fractured shale and the underlying deeper shales is extremely variable, the deeper shales generally have a lower permeability and the average velocity of groundwater in the deep groundwater system is expected to be slower than in the shallow system.

Groundwater in both the shallow and deep systems is expected to flow primarily laterally, following complex flow paths governed by the complex pattern of fracturing in the shale bedrock. Thus, it is generally not possible to determine the exact direction of groundwater flow at any one location in the site area. However, in general under the site area groundwater flows toward the southeast, with a minor component of downward flow.

Groundwater elevations in selected wells over the site area were recorded during the period of late February, 1993 to May, 1993, and are presented in Table 1. The groundwater elevation data indicate that the water table elevation mimics local topography, and the general direction of groundwater flow is from the northwest to the southeast. Vertical hydraulic gradients recorded at well nests were consistently downward.

3.0 RESULTS OF THE GROUNDWATER SAMPLING PROGRAM

3.1 Sampling Program

Two rounds of groundwater sampling were conducted by Golder Associates Ltd, on April 5 to 12, 1993, and May 7, 1993. In total, 11 separate wells were sampled, with 2 wells being included in both sampling rounds. These wells are located east of the former Halton Region Landfill. Groundwater samples from the first round were analyzed for inorganic parameters including metals (cations), anions, and nitrogen compounds, and volatile organic compounds (VOCs); samples from the second round were analyzed for VOCs only. The wells which were sampled in each round and the parameters analyzed are listed in Table 2. All samples were submitted to Barringer Laboratories in Mississauga for analysis. Details of the field procedures are given in Appendix A.

As well, two rounds of groundwater sampling were conducted by CRA, on March 26 and April 6-7, 1993. In total, 15 separate wells were sampled, with 6 wells being included in both sampling rounds. These wells are located downgradient of the former Bayview Park Landfill. Samples from the first round were submitted to Barringer Laboratories for analysis of alkalinity, chloride, sulphate, and VOCs. Samples from the second round were submitted to Mann Testing Laboratories in Mississauga for analysis of VOCs, and the CRA laboratory in Waterloo for analysis of alkalinity, chloride, ammonia, total yeldhal nitrogen, and phenols. Analytical results were provided to Golder Associates by CRA. The wells which were sampled in each round and the parameters analyzed are listed in Table 2.

3.2 General Chemistry Results

The groundwater quality in the site area is strongly influenced by the local geology. Dissolution of minerals from the shale bedrock has caused saline groundwater which is high in total dissolved solids, and which is not of acceptable quality for use as drinking water. This is true of both the shallow and deep groundwater systems, although the mineralization is more pronounced in the deep flow system. As noted in previous studies of the immediate site area (eg. CRA, 1993; Henderson Paddon Environmental, 1993) natural or background concentrations of many inorganic parameters in the local groundwater are above their respective Ontario Drinking Water Objectives. These parameters include chloride, hardness, alkalinity, and many metals including iron, and manganese. Thus, it is not possible to distinguish minor leachate contamination from

the naturally saline, poor quality groundwater present in the shallow and deep groundwater systems using most inorganic parameters.

The analytical results for inorganic parameters in groundwater samples obtained in the Golder Associates and CRA field programs are summarized in Tables 3 and 4. Ontario Drinking Water Objectives (ODWO) are also shown on Tables 3 and 4 for comparison. Table 5 summarizes the field measurements of pH, electrical conductivity, and temperature obtained during sampling by Golder Associates. Laboratory data sheets are presented in Appendix B. The following parameters were found at concentrations greater than ODWO levels in at least one groundwater sample: alkalinity, chloride, sulphate, hardness, aluminum, boron, cadmium, iron, manganese, and sodium. As mentioned above, the observed concentrations of these parameters are representative of the groundwater quality in the area, upgradient and downgradient of the landfills,and therefore do not indicate leachate impacts from the Halton Regional or Bayview Park landfills.

Organic nitrogen was present at concentrations in excess of the ODWO of 0.15 mg/L in many groundwater samples. The source of nitrogen is unclear. However, it is possible that high levels of total dissolved solids in the groundwater samples have caused interferences in the analytical results for nitrogen compounds, resulting in artificially high levels of organic nitrogen to be reported. Alternatively, it is possible that either the shale bedrock, infiltrating spring snow-melt and precipitation, or migrating leachate from the landfills may be the source of nitrogen compounds in the groundwater.

3.3 Volatile Organic Compound Results

The analytical results for VOCs in groundwater samples obtained in the Golder Associates and CRA field programs are summarized in Tables 6 and 7. ODWO levels are given on Tables 6 and 7 for comparison. Laboratory data sheets are presented in Appendix B.

The results of the Golder Associates monitoring program show that trace to low levels of a number of volatile organic compounds were detected in groundwater samples taken from wells located near the west side of the site, downgradient from the Halton Regional Landfill. All compounds were detected at concentrations well below their respective ODWO levels. The detected compounds were:

- benzene, toluene, ethyl benzene, and xylenes (BTEX) at trace to low levels (0.1 to 7.1 μg/L). One or more of these compounds was detected in 7 of the 11 tested wells;

- a trace level of chlorobenzene (0.3 μg/L) detected in one well;

- Dichlorobenzene (one or more isomers) at trace levels (0.1 to 0.3 μg/L) in 4 of the 11 tested wells;

- trace to low levels (0.1 to 2.4 μg/L) of chlorinated aliphatic VOCs, including vinyl chloride, chloroethane, dichloroethane, dichloroethene, trichloroethane, trichloroethene, and tetrachloroethene. At least one of these compounds was detected in 7 of the 11 tested wells. In case of vinyl chloride, which was detected in three wells (HC3-85-3, HC5-85-1, PW-2) at concentrations up to 1.1 μg/L, there is no specified ODWO. However, the United States Environmental Protection Agency has set a Maximum Contaminant Level for vinyl chloride in drinking water of 2 μg/L. The detected levels of vinyl chloride are below this guideline. Please note vinyl chloride was not detected in the wells tested during the second round of sampling. These wells were retested to try and confirm its presence or absence.

The results of the CRA monitoring program show that low levels of three chlorinated VOCs were detected in four wells downgradient of the Bayview Park landfill. Chlorobenzene was detected in two samples from well OW4-93 at concentrations of 63.3 and 11.0 μg/L. These values are below the ODWO level for chlorobenzene of 80 μg/L. Well OW4-93 is located immediately west of the Bayview Park landfill, approximately 120 metres northwest (ie. up-gradient) of the Jannock development lands. 1,4-Dichlorobenzene was detected at trace levels (0.2 μg/L) in one of two samples from well OW2B-93. 1,4-Dichlorobenzene and 1,2-dichlorobenzene were detected at trace levels (1.6 and 0.1 μg/L respectively) in one of two samples from well OW4 93. These concentrations are less than the ODWO levels of 5 μg/L and 200 μg/L, respectively. In both cases dichlorobenzene was detected only in first round samples, however the method detection limit for this compounds increased from 0.2 to 1.0 μg/L from the first to the second sampling rounds, therefore the results of both rounds are consistent. Low levels of 1,1,1-trichloroethane were detected at wells OW2A-93 and OW3-93 (1.5 and 1.1 μg/L respectively) in the second sampling round only.

As shown on Table 7, groundwater samples from all 6 of the wells tested in the first sampling round contained low concentrations (less than 4.0 μg/L) of BTEX. Samples obtained from these wells in the second sampling round did not contain detectable levels of BTEX. These apparently

inconsistent results may be due to one of several factors: contamination of the first round samples by sampling or laboratory activities, a change in analytical laboratories and a corresponding increase in method detection limits from approximately 0.2 to 0.5 μg/L between tbe first and second sampling rounds, or transient low-level concentrations of BTEX in the groundwater down gradient from the Bayview Park landfill. In any case, as discussed below the presence of BTEX in groundwater samples is not necessarily an indication of leachate contamination of groundwater in the immediate area.

In summary, the results of groundwater monitoring for VOCs down-gradient from the Halton Regional and Bayview Park landfills indicate that trace to low concentration of some VOCs are present in some locations in the groundwater underlying the Jannock development lands. However, VOCs were detected at concentrations below established guideline levels. The results of previous monitoring programs at the Halton Regional and Bayview Park landfills indicate that generally, VOCs have been detected only sporadically and at trace to low levels (ie. less than 10 μg/L) in groundwater downgradient of the landfills. This is in general agreement with the results of the groundwater sampling program undertaken for this study.

The results of previous monitoring programs also indicate that benzene, ethyl benzene, and toluene have historically been detected in some background groundwater samples taken from wells upgradient of the Halton Regional Landfill (Henderson Paddon Environmental, 1993). As low levels of non-chlorinated VOCs, specifically benzene, toluene, ethyl benzene, and xylenes (BTEX) may originate from the shale bedrock, the presence of low levels of BTEX in groundwater down-gradient from the landfills does not necessarily indicate leachate impacts. However, the observed presence of trace to low levels of chlorinated VOCs, including chlorobenzene, vinyl chloride and other chlorinated aliphatic compounds, indicates that groundwater underlying the site may have been slightly impacted by leachate from both landfills.

As stated previously, the natural quality of groundwater underlying the site area is unacceptable for drinking water purposes and the proposed site development will not use local groundwater but will rely on municipal services. Therefore the observed quality of groundwater underlying the site, including the presence of low levels of volatile organic compounds, should not pose a problem to future development of the site.

4.0 RESULTS OF THE SURFACE WATER SAMPLING PROGRAM

4.1 Sampling Program

Four surface water sampling stations were established by Golder Associates on the site down stream from the Halton Regional landfill, as shown in Figure 2. Three stations (SW-A, SW-B, SW-C) are located in the Indian Creek watershed. The remaining station (SW-D) is located in the Falcon Creek watershed. One round of surface water sampling was conducted by Golder Associates Ltd, on April 5, 1993. Samples were obtained from all 4 surface water stations. Samples were analyzed for a suite of inorganic parameters including metals (cations), anions, and nitrogen compounds, and volatile organic compounds (VOCs). Details of the sampling program are given in Table 2. All samples were submiKed to Barringer Laboratories in Mississauga for analysis. Details of the field procedures are given in Appendix A.

A number of surface water stations have been established in the vicinity of the Bayview Park landfill as part of ongoing monitoring activities. Surface water sampling at many of these stations was conducted by CRA, on April 6-7, 1993. In total, fifteen samples (one per sample station) were obtained from 15 separate surface water stations. Details of the sampling program are given in Table 2, and surface water station locations are shown on Figure 2. Samples were submitted to Mann Testing Laboratories in Mississauga for analysis of VOCs, the CRA laboratory in Waterloo for analysis of alkalinity, chloride, ammonia, total kjeldhal nitrogen, sulphate, and phenols, and to Standard Biological Laboratories in Mississauga for analysis of fecal and total coliform and fecal streptococcus bacteria. Analytical results were provided to Golder Associates by CRA.

4.2 General Chemistry Results

The analytical results for inorganic parameters in surface water samples obtained in the Golder Associates and CRA field programs are summarized in Tables 8 and 9. Ontario Provincial Water Quality Objectives (PWQO) are also shown on Tables 8 and 9 for comparison. Table 10 summarizes the field measurements of pH, electrical conductivity, and temperature obtained during sampling by Golder Associates. Laboratory data sheets are presented in Appendix B.

Of the stations sampled for this study, Stations SW9-87, SW11-87, and SW12-87 are located upstream of the landfills and are expected to indicate background (un-impacted) surface water

quality (Figure 2). Suspected leachate impacts to downgradient surface water have been determined based on the range of parameter concentrations in samples taken from these background locations. It should be noted that the analyses performed on background samples include only alkalinity, chloride, sulphate, ammonia, TKN, phenols, and bacteria.

Elevated levels of chloride (over the maximum observed background level of approximately 60 mg/L) and elevated levels of alkalinity (over the maximum observed background level of approximately 270 mg/L) were detected at stations SW5-87, SW7-87, and SW14-93. The sample from station SW7-87 also contained relatively high concentrations of sulphate (307 mg/L) and aqueous ammonia (0.90 mg/L). Based on these results, it is likely that surface water at these three locations has been slightly impacted by landfill leachate. Station SW5-87 is located northeast of the Bayview Park landfill and is not on or upstream of the Jannock site. However stations SW7-87 and SW14-93 are located on the same stream southeast of the Bayview Park landfill, at the north and south boundaries of the Jannock site respectively (Figure 2). This indicates that surface water in the eastern part of the site, down-stream of the Bayview Park landfill, may be slightly impacted by leachate from that landfill. This is in general agreement with the results of previous monitoring programs at the landfill. The results of surface water monitoring at stations SW-A TO SW-D, down-stream of the Halton Regional landfill, do not indicate leachate impacts to surface water.

4.3 Volatile Organic Compound Results

The analytical results for VOCs in surface water samples obtained in the Golder Associates field program are summarized in Table 11. No VOC compounds were detected in surface water samples obtained in the CRA field program. Laboratory data sheets are presented in Appendix B.

Trace levels (up to 0.3 μg/L) of VOCs were detected in samples from only three of the stations sampled: SW-A, SW-C, and SW-D. The compounds detected were benzene, toluene, m&p-xylenes, chloroform, and trichloroethene. There are no PWQO levels for these compounds. It is possible that the low concentrations observed (ie. less than 0.5 μg/L) of these compounds may have been caused by contamination during sampling or laboratory procedures. This is supported by the inconsistent results for chloroform, benzene, and m&p-xylenes in the blind duplicate sample from location SW-D (see Table 11).

5.0 RESULTS OF THE GAS MONITORING PROGRAM

5.1 Field Program

Five gas monitoring probes (GA1-93 to GA5-93) were installed along the western site boundary adjacent to the Halton Regional landfill by Golder Associates, on March 29-31, 1993. The gas probes were purposely installed during frozen ground conditions. In addition, one gas monitoring probe (GP2-93) was installed at the western boundary of the Bayview Landfill, northeast of the Jannock development lands, and three probes (GP1-93, GP3-93 and GP4-93) were installed at the southeastern boundary of the proposed Bayview Park landfill buffer/attenuation zone by CRA. Gas probe locations are shown on Figure 2.

The concentration of total combustible gases, including methane, in gas probes has been monitored on regular (approximately weekly) basis by Golder Associates. Details of the Golder Associates field program are given in Appendix A. Gas probe construction details are shown on the Record of Borehole sheets included with this report.

Please note that Golder Associates has been informed that the proposed development plan being prepared by Jannock does not call for development to take place within 30 m of the former landfill sites. We understand that the proposed development will include a peripheral area set back of at least 30 m adjacent to the former Halton Region Landfill. The proposed buffer/attenuation zone adjacent to the former Bayview Park Landfill would provide a peripheral area set back of approximately 140 m. The location of the proposed buffer/attenuation zone boundary would approximate the southern edge of the hickory forest wood lot adjacent to the Bayview Park Landfill.

Both landfills are located within the 500 m distance interval whereby an assessment of potential adverse affects from methane gas may be required, as outlined in MOEE Policy 07-07. Data obtained from CRA indicates that the thickness of unsaturated refuse within the Bayview Park Landfill ranges from about 6.4 m to 16.2 m with an average of about 9.9 m. This data was obtained from borehole logs prepared at the time of leachate sampling well installation at the landfill. The D_{10} distance would therefore be about 100 m. This represents the distance envelope within which potential methane gas should be monitored near to landfill sites as specified within the MOEE Guideline for Assessing Methane Hazards from Landfill Sites, 1987. The Jannock

lands would not fall into this envelope since the proposed buffer/attenuation zone would extend beyond 140 m.

5.2 Results of the Gas Monitoring Program

The results of the gas probe monitoring program are given in Tables 12 and 13. For all monitoring events, including readings obtained on the day of the gas probe installation, concentrations of total combustible gases were non-detectable. It should be noted that after initial drilling and gas probe installation, spring flooding conditions resulted in the groundwater table rising to close to the ground surface until approximately mid-May. As a result, many of the gas probe intake screens were below the water table, which would prevent the entry of soil gases into the probes. During monitoring events in late April and May, 1993, groundwater was pumped from probes until the groundwater levels were below the top of the probe screens, and repeat gas measurements were taken. By mid-May, the water table elevation had fallen and all gas probe screens were above the water table.

The results of gas monitoring to date have not detected measurable levels of combustible gases, including methane, migrating through the subsurface from the Halton Regional and Bayview Park landfills onto the Jannock development lands.

Migration of landfill gases from the Halton Regional Landfill onto the Jannock site is expected to be prevented by the presence of a topographic depression along the western boundary of the Jannock site. As illustrated in the cross-section presented on Figure 3, it is likely that any soil gases will be vented to the atmosphere as they travel laterally eastward from the landfill and intersect the ravine present in the area of gas probe GA1-93. A topographic low (a ravine or a ditch) is present along most of the western boundary of the Halton Region Landfill.

6.0 CONCLUSIONS AND RECOMMENDATIONS

6.1 Conclusions

The following conclusions are made, based on the results of this study:

1. The groundwater in the area of the Jannock development lands is naturally saline and contains high concentrations of dissolved solids due to natural sources. This groundwater is not of acceptable quality as a drinking water supply.

2. Alkalinity, chloride, sulphate, hardness, aluminum, boron, cadmium, iron, manganese, and sodium were found at concentrations greater than ODWO levels in at least one groundwater sample from the site area. However, the observed concentrations of these parameters are representative of groundwater quality both upgradient and downgradient of the landfills and do not indicate the presence of leachate from the Halton Regional or Bayview Park landfills. Organic nitrogen was also present at concentrations over the ODWO in many groundwater samples. The source of nitrogen is unclear, and it is possible that either laboratory inaccuracies, natural sources, or migrating leachate from the landfills may be the source of nitrogen compounds in the groundwater.

3. The results of groundwater monitoring for VOCs down-gradient from the Halton Regional and Bayview Park landfills indicate that trace to low concentrations of some VOCs, including chlorinated VOCs, are present in some locations in the groundwater underlying the Jannock development lands. Based on the results of this study and previous monitoring programs at the landfills, the presence of chlorinated VOCs indicates that the groundwater underlying the Jannock development lands has been slightly impacted by landfill leachate. The concentrations detected are less than the current ODWOs. These impacts should not pose a problem to the proposed development of the site.

4. Based on the results of surface water monitoring performed for this study, it is likely that surface water at some locations down-stream from the Bayview Park landfill, including 2 locations at the north and south boundaries of the Jannock development lands, has been slightly impacted by inorganic compounds in leachate. There is no clear evidence of surface water impacts by VOCs.

5. The results of regular gas monitoring at the site to date indicate that no detectable levels of combustible gases, including methane, have migrated through the subsurface from the Halton Regional and Bayview Park landfills onto the Jannock development lands, during the monitoring period.

6. The proposed Jannock Properties development, consisting of fully serviced, slab-on-grade industrial buildings located a minimum of 30 metres from the former fill areas, should not be affected by landfill gases or leachate migrating through the subsurface, or by leachate migrating in surface waters, from the closed Halton Regional or Bayview Park landfill. The proposed use of the property should not be affected, nor adversely impact existing groundwater or surface water quality provided proper storm-water and surface

water management plans are followed. Existing groundwater and surface water conditions should not impact the proposed development.

6.2 Recommendations

Based on the results of this study, the following recommendations are made for the purpose of minimizing potential environmental liabilities at the Jannock development site:

1. A regular groundwater and surface water monitoring program should be continued at the Halton Regional landfill by the Regional Municipality of Halton. The results and assessment of the program should be forwarded to the Jannock Brick Group on an annual basis. This is a condition of the landfill closure Certificate of Approval. The monitoring program should be revised to incorporate gas monitoring adjacent to the Jannock site, and surface water monitoring at Stations upstream of the Jannock site.

2. A regular groundwater and surface water monitoring program should be continued at the Bayview Park landfill by the City of Burlington. This is a condition of the landfill closure Certificate of Approval which the results and assessment of the program forwarded to the Jannock Brick Group on an annual basis. The monitoring program should be carried out in accordance with the Rationalized Monitoring Program, including gas monitoring proposed by CRA/Golder Associates in January, 1993.

3. A rigorous storm water and surface water management plan be followed for the proposed development, to prevent undesirable impacts to surface water, both during construction phases and during normal operations at the development. Golder Associates understands that this is being undertaken by Aquafor Engineering Limited, on behalf of Jannock. This program also includes set back from all surface water courses.

4. On-site monitoring wells which are not to be used in the above monitoring programs be inspected and fitted with locked caps, or be properly abandoned in accordance with Ontario Regulation 612/84.

We trust this information meets your current requirements. Should you have any questions please feel free to contact us.

APPENDIX A

FIELD PROCEDURES

July, 1993

911-1602

APPENDIX A - FIELD METHODS

A.1 Borehole Drilling and Gas Probe Installation

Gas monitoring probes were installed at 5 locations on the Jannock development site during March 29 to 31, 1993. The location of the probes, GA1-93 to GA5-93, are shown on Figure 2. At one location, GA3-93, two probes were installed at different depths below ground surface. Probe GA3-93 is the deeper probe (approximately 6 metres below ground surface) and probe GA3A-93 is the shallower probe (approximately 3 metres below ground surface). All gas probe locations are shown on Figure 2 of this report.

Borehole drilling was carried out using an Acker AD-II power auger equipped with 108 mm hollow-stem augers, owned and operated by Longyear Canada Inc. Boreholes GA1-93 was advanced through the surficial soils and weathered shale using hollow stem augers, and soil samples were obtained at approximately 0.7 metre intervals using a split-spoon sampler. The deeper portion of the borehole was advanced through shale bedrock using diamond drilling with an HQ size drill bit, advanced through the hollow stem augers. The remainder of the boreholes were advanced using hollow-stem augers only, through unconsolidated soils and weathered shale. Gas probes were installed in each borehole. The probes were constructed of 13 mm diameter, schedule 40 PVC riser pipes and 1.5 metre lengths of hand-slotted, 13 mm diameter, schedule 40 PVC screens wrapped in PVC filter socks. Gas probe screens were surrounded with a silica sand filter pack. A bentonite seal was placed above the sand pack to ground surface. Details of the subsurface stratigraphy and gas probe construction at each location are shown on the Record of Borehole Sheets included with this report.

The ground surface and top of casing elevation at each gas probe was surveyed by Golder Associates field staff. Elevations were referenced to the top of manhole MH31 at the Halton Regional Landfill, with a reported elevation of 432.00 ft asl (131.67 m asl).

A.2 Gas Monitoring

The concentration of total combustible gases, including methane, was monitored by Golder Associates staff on an approximately weekly basis at 10 gas probes/wells: GA1-93, GA2-93, GA3-93, GA4-93, GA5-93, GP1-93, GP2-93, GP3-93, OW1B-93, and PW-3. The locations of these gas probes/wells are shown on Figure 2. Monitoring was conducted with a Gastechtor total

combustible gas monitor calibrated to a 100 ppm hexane gas standard. Readings of total combustible gases are expressed as a percent of the hexane lower explosive limit (LEL) concentration of 11,000 ppm. Therefore, a reading of 100% LEL is equal to 11,000 ppm, hexane-equivalent units.

Following gas monitoring at each location, the depth to water in the gas probe or well was determined with an electronic water level metre. During several monitoring events, if the gas probe screen was below the water table, water was pumped from the probe standpipe using a peristaltic pump, and a repeat gas measurement was taken.

A.3 Groundwater and Surface Water Monitoring

Groundwater sampling of selected monitoring wells was performed by Golder Associates staff in two rounds of sampling, on April 3 to 12, 1993, and on May 7, 1993. The wells which were sampled in each round are shown on Table 2 of this report. Groundwater levels were determined with an electronic water level metre prior to well development and sampling. Wells were developed prior to sampling by removing at least 3 well volumes of water from each well. Purge water pH, temperature and electrical conductivity were monitored to confirm well development. Immediately after well development, groundwater samples were collected using dedicated or pre-cleaned sampling pumps. Well PW-2 was sampled using a submersible Redi-Flo-2 pump. All other wells were sampled using dedicated HDPE tubing and foot-valves (Waterra pumps). Groundwater samples were collected into laboratory-supplied, pre-cleaned sample containers. Samples for metals analysis were filtered and acidified in the field. All samples were transported in refrigerated containers to Barringer Laboratories for analysis.

Surface water sampling was conducted by Golder Associates staff on April 12, 1993. Samples were collected at 4 locations down-stream from the Halton Regional Landfill, at stations SW-A, SW-B, SW-C and SW-D. Station locations are shown on Figure 2. Samples were collected directly into laboratory-supplied, pre-cleaned containers. Temperature, electrical conductivity, and pH were measured in the field at each station. Samples were transported in refrigerated containers to Barringer Laboratories for analysis.

LEGEND: M.D.L. = METHOD DETECTION LIMIT
ND = NOT DETECTED
DUP. = DUPLICATE
* = DETECTED BELOW M.D.L. BUT PASSED COMPOUND IDENTIFICATION CRITERIA

ANALYTICAL METHOD:

The samples were analysed by purge & trap gas chromatography/mass spectrometry using the internal standard method of quantitation.

REPORT DISCUSSION:

The surrogate standard recoveries were within the control limits for the analytical method for all samples. The target compound quality control spike recoveries were in the normal range for the analytical method.

CLIENT: GOLDER ASSOCIATES LTD. VOLATILE ORGANIC COMPOUNDS DATE: 20-May-93
PROJECT REFERENCE: 911-1602
W.O. # 93-5379V
MATRIX:WATER

LEGEND: M.D.L. = METHOD DETECTION LIMIT
ND = NOT DETECTED
DUP. = DUPLICATE
* = DETECTED BELOW M.D.L. BUT PASSED COMPOUND IDENTIFICATION CRITERIA

ANALYTICAL METHOD:

The samples were analysed by purge & trap gas chromatography/mass spectrometry using the internal standard method of quantitation.

REPORT DISCUSSION:

The surrogate standard recoveries were within the control limits for the analytical method for all samples. The target compound quality control spike recoveries were in the normal range for the analytical method.

1.0 INTRODUCTION

The City of Burlington and Jannock Ltd. have undertaken a joint technical review of the performance and impacts of the Bayview Park Landfill. This review allows the City of Burlington to determine the most appropriate buffer/attenuation zone, monitoring requirements, and contingency measures for this closed landfill site. The results of this review also allows Jannock Ltd. to evaluate the suitability of development of its adjacent lands south of the landfill in accordance with the provisions the Ministry of Environment Policy 07-07.

A joint City of Burlington/Jannock Ltd. report entitled, "Concept Proposal, Bayview Park Landfill Buffer Zone/Monitoring Requirements and Development of Lands South of Bayview Park Landfill" dated January 1993, was prepared by CRA/Golder and was subsequently presented to the Ministry of Environment and Energy (MOEE) on February 8, 1993.

The Technical review as outlined within the Concept Proposal consisted of the following components:

i) definition of the limits of a proposed Buffer Zone;
ii) installation and initial sampling of six monitoring wells at four locations along the proposed buffer zone boundary;
iii) installation and monitoring of three shallow gas probe installations;
iv) the synoptic sampling of all historically monitored and proposed buffer boundary surface water and groundwater monitoring locations;
v) technical evaluation of existing and anticipated Site environmental impact which also includes an evaluation of leachate collection system performance;
vi) rationalization of the current monitoring program which will include leachate collection system monitoring and maintenance requirements;
vii) evaluation of contingency options if unacceptable impacts are occurring; and

viii) address all issues (in a companion report) that are associated with MOEE Policy 07-07 with respect to land use development adjacent to landfill sites.

In a February 23, 1993 letter to Doug Brown (COB) the MOEE advised that they agree in principle with the above-noted Concept Proposal technical review. However, MOEE asked that the following be taken into consideration:

i) the ministry stated concern that proposed surface water monitoring well SW9A-92 is representative of true background surface water quality; and

ii) that once the proposed program is completed and further information presented on drilling in the general area, the Ministry will have an opportunity to require some specific input if required.

The purpose of this report is to present, based on the technical review as outlined in the Concept Proposal, an environmental performance evaluation and rationalized monitoring program for the closed Bayview Park Landfill Site, based on the proposed buffer zones, recognition of the proposed adjacent land use developments and the above noted MOEE considerations.

1.1 CURRENT LAND USE SITUATION

The Bayview Park Landfill Site is located on the west side of King Road north of Highway 403 within the City of Burlington (COB) (see Figure 1.1). The Site was operated as a landfill by the Town of Flamborough, and then the COB from 1957 to 1972. In 1972, the Site was closed under MOE Provisional Certificate No. 210103 and subsequently amended in May 1986. The Site is currently operated as a Park facility. A copy of the amended Certificate of Approval No. 210103 is provided in Appendix A. A leachate collection system was also installed in 1986, to control observed leachate seepage into adjacent tributary of Indian Creek. The Certificate of Approval

No. 3-0819-86-007 for the construction and operation of the leachate collection system is also provided in Appendix A. All collected leachate/groundwater is directed via gravity forcemain to the Regional Municipality of Halton, Skyway Waste Water Treatment Plant.

The property adjacent to the Bayview Park Landfill was formerly owned by National Sewer Pipe (NSP). These lands were designated as Site "F" and were subject to an exhaustive environmental assessment in the matter of an application by The Regional Municipality of Halton for landfilling at this locality. A lengthy hearing before the Joint Board as mandated by The Consolidated Hearings Act 1981, was held to evaluate Site "F" suitability for landfilling. The outcome of this hearing resulted in Site "F" not being selected for the Regional Landfill.

The NSP property has since been purchased by Jannock Ltd. through its subsidiary 873805 Ontario Inc. Jannock is planning to continue to quarry within the licensed portion of the property and is also pursuing the development of prestige industrial land fronting along the North Service Road. As such, given the above land use developments, several issues have arisen which necessitate the development of a rationalized landfill site buffer zone and monitoring program in order to effectively monitor the performance of the site and to allow for the implementation of remedial measures as, and if, required. These outstanding issues are summarized below:

i) A number of the off-Site observation wells currently utilized for monitoring are located on lands slated for development.

ii) There is a need to acquire buffer lands in order that the City of Burlington has access to repair the Leachate Collection System as needed and to allow for a contaminant attenuation zone downgradient of the Bayview Park Landfill. This contaminant attenuation zone would be utilized to attenuate any landfill derived contaminants and provide boundary impact monitoring capabilities in order to evaluate site compliance as outlined within relevant MOEE policies.

iii) There is a need to verify that downgradient groundwater and surface water quality at the proposed buffer zone boundary is consistent with historical downgradient water quality.

iv) Furthermore, as previously stated, there is need to verify that the lands proposed for development by Jannock comply with all provisions of MOE policy 07-07 regarding development adjacent to former waste disposal sites. A report which in part will utilize the results of this technical review has been prepared, under separate cover, by Golder Associates for Jannock to address the above Policy 07-07 provisions.

2.0 HISTORICAL SITE PERSPECTIVE

Between 1979 to 1985, the MOE conducted site inspections which included the collection of samples for chemical analysis of both leachate seeps around the landfill and upper reaches of Indian Creek. These MOE results indicated levels greater than surface water objectives of coliform and heavy metal levels, and low level chlorinated organics. The results also illustrated that the leachate seeps had impacted the water quality in the adjacent creek.

In a letter dated May 24, 1985, the MOE requested that the COB respond to the observed leachate seeps and apparent creek contamination. On May 30, 1985, the COB requested that Conestoga-Rovers & Associates (CRA) undertake a review of this issue. The results of this investigation were summarized in a report entitled "Bayview Park Landfill/Indian Creek Contamination Investigation, City of Burlington" dated July 1985. This investigation verified the presence of leachate seeps and contaminated groundwater emanating from the landfill and impacting surface water. The report identified a need for the implementation of leachate control measures, and a monitoring program that would evaluate the impact of any control measures installed at the Bayview Park Landfill Site.

In a letter to the COB dated October 2, 1985 from B.A. Singh, P. Eng., the MOE requested:

> *"A comprehensive monitoring program assessing the impacts and recommending controls for gas and leachate both off site and on site is required. We ask that you submit terms of reference for this program for approval on or before November 15, 1985."*

On behalf of the COB, CRA prepared a draft "Terms of Reference 1986 Monitoring Program". In November 1985, this report was submitted to the MOE for comment. CRA subsequently revised and implemented the 1986 monitoring program to reflect the general intent of the MOE comments.

In response to Ministry of Environmental (MOE) concerns regarding surface water contamination of the creek adjacent to the Site, the City of Burlington commenced the design of a leachate control system in 1985. The purpose of the leachate control system was to prevent surface water contamination of a tributary of Indian Creek adjacent to the Site as a result of overland leachate seepage, and control shallow off-Site groundwater contamination. A review of possible remediation techniques was presented in the report entitled "Remedial Alternatives, Bayview Park Landfill Leachate Controls" (CRA, July 1985).

The design of the selected remedial alternative was described in the report entitled "Conceptual Design Report, Leachate Collection System, Bayview Landfill Site" (CRA, January 1986). The leachate control system consists of a west side gravity toe drain collection system, and three gravity collection drains located in ravines along the south side of the Site. The west side toe drain and south side ravine drains consist of perforated PVC pipe in a clear stone bedding which drain to two pump stations located in the south side ravines.

The two pump stations discharge to a gravity sewer located along the south side of the Site and the west side of King Road. The gravity sewer was connected to an existing sanitary sewer located along King Road south of Highway No. 403.

Construction of the leachate control system was undertaken in 1986 under City of Burlington Contract No. 86-16. The leachate collection system was approved under MOE Certificate of Approval No. 3-0819-86-007 (Appendix A) dated July 16, 1986.

On July 16, 1986, the MOE revoked condition No. 1 of the Provisional Certificate of Approval No. 210103 dated October 11, 1973 and replaced it with four new conditions. Conditions 1 to 3 dealt specifically with the construction of the LCS. Condition 4 reads as follows:

"The City shall carry out the monitoring and inspection program as approved by the Regional Director with such modification as may be approved from time to time by the Regional Director. On or before March 1st of each year, the City shall file a report with the Regional Director containing an analysis and evaluation of the monitoring and inspection program for the previous year."

Monitoring has been undertaken since 1986 and eight annual monitoring reports have been submitted to the Director as per Condition 4. A complete Reference listing of previously submitted annual monitoring reports is provided with this report.

The 1986 program was prepared to evaluate the present environmental impact of the Bayview Landfill on surface water, and to provide a basis for evaluating on the effectiveness of the LCS which was installed during the latter part of 1986. The program included: landfill gas monitoring, leachate levels, leachate seep inspections and the sampling of 10 surface water locations on a quarterly basis. In addition, 10 surface water and sediment sample locations were sampled on an annual basis for priority pollutant analysis.

Groundwater monitoring was not conducted in 1986 in order that a comprehensive review could be undertaken of the significant groundwater data base that had been developed for the adjacent National Sewer Pipe lands (NSP) (which was then designated as the proposed Halton Regional Landfill Site F). This comprehensive review of the groundwater database was undertaken as part of the 1986 monitoring program.

Generally speaking because of the nature of the underlying near surface fractured shale bedrock and the natural poor groundwater quality (i.e. very high chlorides, sulphate, total dissolved solids) it was stated that it may not be possible to delineate the extent of groundwater contamination.

The 1986 monitoring Report largely concluded the following:

1) Prior to the construction of the leachate collection system, surface leachate discharge from the landfill had exerted a measurable impact on surface water quality downstream of Bayview Park. However, it cannot be attributed to leachate seepage alone.

2) No PCBs were detected in any of the leachate water or sediment samples

3) Groundwater impact, based primarily on an evaluation of organic nitrogen data, may extend downgradient to and possibly beyond Highway 403.

Based on the 1986 review, a groundwater component to the annual monitoring program was implemented as part of 1987 monitoring event which involved the collection of nitrate, nitrite, TKN and free ammonia from selected well nests. In addition a limited suite of volatile organic compounds (VOC) were analyzed at selected groundwater locations on an annual basis.

The 1987 monitoring program concluded amongst other considerations that the installation of the LCS has resulted in the reduction of the impact on the surface water quality, however more data was required to further quantify this reduction. Impaired surface water quality was noted at background upstream locations as well as downstream of the site. No PCBs were detected at any surface water locations. Furthermore, all major seeps identified in 1986 and outbreaks noted in 1987 have been contained. It was also determined that organic nitrogen is not, as was previously believed, a diagnostic indicator of groundwater contamination at this site and that the source of detected toluene concentrations within the groundwater needed to be further documented. The recommended 1988 monitoring program included a re-evaluation of groundwater monitoring locations so as to ensure that the wells are screened within the active groundwater flow zones originating from the landfill. In addition, those wells completed with suspect well construction materials (i.e. glued joints) were deleted from the program.

The 1988 report generally reiterates similar conclusions as was previously outlined in the 1987 report. Salient conclusions included that, the installation of the LCS has resulted in the reduction of impact on the surface water quality however more data would be required to fully evaluate the effects of the installation of the collection system. The report further concludes that bacteriological parameters are not a useful indicator of groundwater contamination. Also off-site groundwater appears to be characterized by the sporadic occurrence of volatile organics at trace levels which were largely attributed to a natural source. No PCBs were detected with the surface water and further evaluation of background surface water quality was also required. It was also recommended that a refinement in the groundwater monitoring network was required in order to conduct widespread sampling of the shallow or active groundwater flow zone.

The conclusions presented within the 1989 report are generally consistent with that presented as part of previous reports. Comments from the MOE regarding the draft copy of the 1989 Monitoring Report were received on March 3, 1992. The following summarizes MOE comments:

- Sampling of volatile organic compounds (VOCs) be continued in order to establish concentration profiles and confirm that the presence of VOCs are possibly derived from the shale bedrock.

- 1989 monitoring program be continued in 1990 along with additional sampling on off-Site groundwater monitoring wells at HC6 and HC7, the shallow well at HC4 and deep well at HC9 so as to properly assess the affects of landfill leachate.

- Reasons for elevated leachate levels at LW4 should be determined.

The above comments, where appropriate, were incorporated with the 1990 monitoring report. Conclusions from the 1990 and 1991 monitoring program are consistent with previous reports.

The MOE provided comments on the 1990 and 1991 Monitoring Reports on November 5, 1992. The primary MOE comments are presented below:

1) It is very difficult to determine the impacts of leachate on the groundwater system at this Site because of poor background water quality and complex fracture characteristics of the underlying shales. The monitoring program conducted in 1990 and 1991 needs to be continued in order to expand the existing groundwater database. This will enable a more confident interpretation of the groundwater system in the future.

2) "It is acceptable to measure leachate levels twice per year instead of four times per year provided there are no noticeable changes to leachate levels in the future."

The 1992 Monitoring Progress Report (CRA March 1993) concluded that there is minor impact on general chemistry surface water quality immediately downstream of the Bayview Park landfill. Reduced pumping of the leachate collection system, coupled with unusually high amounts of precipitation during 1992 may in part have contributed to observed surface water impact. However, this impact is not deleterious as Provincial Water Quality Objectives for the parameters analyzed were met downstream. Furthermore, surface water quality downstream of the Site along the North Service Road is comparable to background quality. The 1992 report also concluded that the detected occurrence of volatile organic compounds in leachate and groundwater is generally seen to be sporadic and characterized by low or trace levels only. The persistent low level occurrences of chlorobenzene in groundwater (2.6 to 3.3 µg/L) of PW3 are interpreted to be landfill derived.

The 1993 monitoring program (CRA March 1994) report concluded that there is a minor surface water quality impact as a result of shallow impacted groundwater discharge with respect to increased chloride and unionized ammonia concentrations at landfill vicinity surface water monitoring locations as compared with upstream and downstream surface

water monitoring locations. Bacteria levels were detected above PWQO's at surface water monitoring locations SW6-87, SW7-87, SW8-87 and SW13-88. These levels are attributed to an upgradient (of the landfill) surface water/groundwater source.

The occurrence of volatile organics in leachate and groundwater continued to be seen to be sporadic and characterized by low or trace levels only.

It was further recommended in the above noted 1992 and 1993 Monitoring Reports that the current monitoring program (not including the proposed 1993 groundwater and surface water monitoring locations) be continued in 1994 until the revised program is formally proposed and agreed to by all parties as part of this technical review.

In summary, the overall effectiveness of the leachate collector in controlling leachate seepage has been demonstrated. The impact on groundwater has been difficult to assess due to the naturally poor groundwater quality and lack of effective inorganic indicator parameters of leachate contamination. It has been determined that the presence of chlorinated volatile compounds may be considered as diagnostic indicators of landfill derived groundwater and surface water impact.

2.1 SUMMARY

In keeping with the above historical perspective, it is appropriate that a landfill site performance re-evaluation be undertaken given recognition of the proposed adjacent land use developments and the documented historical surface water impacts and the subsequent effective control measures. This performance re-evaluation would involve the need for unrestricted access to the engineered leachate collection system, to ensure that surface water impact to the adjacent creek is prevented. This would take the form of a formalized Buffer/Attenuation zone. Furthermore a rationalized groundwater monitoring program is required in order that the

groundwater flow system continue to be monitored in recognition of the proposed downgradient development.

The current (1994) monitoring program consists of the following components:

i) surface water monitoring;
ii) leachate well monitoring;
iii) leachate collection system monitoring;
iv) off-site groundwater monitoring - utilizing selected pumping wells and observation wells installed on behalf of the Region of Halton by Trow Hydrology Consultants; and
v) leachate seep inspections.

The detailed current monitoring specifications are provided in Table B.1 (Appendix B), where as the current 1994 surface water, leachate well and groundwater monitoring locations are provided on Drawing 1.

3.0 FIELD INVESTIGATION

3.1 GENERAL

The field activities, were generally conducted in accordance with the CRA/Golder (January 1993) protocols outlined in Appendix C of the Concept Proposal Report. The only substantive variance with the previously outlined protocols was that the gas probes were installed in separate boreholes in the unsaturated overburden rather than in the same boreholes as the shallow observation wells.

The field activities were conducted by CRA from February 25, 1993 to March 26, 1993 and consisted of the following:

i) the drilling of two deep boreholes and four shallow boreholes in the bedrock at the locations for subsequent observation well installation;

ii) the drilling of three separate boreholes in the unsaturated overburden at the locations for subsequent gas probe installation;

iii) the performance of packer tests at selected intervals in all the coreholes (including sampling and testing of the water discharged during the packer tests for conductivity, salinity and temperature) to determine an optimum location for screen placement;

iv) the installation of four shallow (OW1B-93, OW2B-93, OW3-93 and OW4-93) and two deep (OW1A-93 and OW2A-93) observation wells in each respective borehole as shown on both Figure 3.1 and Drawing 1;

v) the installation and gas level measurement of three gas probes (GP1-93, GP2-93 and GP3-93) at the locations shown on Figure 3.1 and Drawing 1;

vi) the establishment of horizontal and vertical control of the above noted gas probes and observation wells including PW3-86 which was

installed previously in 1986, and the proposed buffer zone boundary surface water monitoring locations;

vii) the March 26, 1993 well development and collection of groundwater samples from each of the newly installed observation well; and

viii) the April 6 and 7, 1993 collection of one synoptic round of groundwater and surface water samples at all Site, historic and proposed, surface water, leachate, and groundwater monitoring locations. This synoptic sampling was to demonstrate the comparative effectiveness of the proposed groundwater and surface water monitoring locations with historically monitored locations; and

ix) the analysis of the above-noted groundwater and surface water samples for selected general chemistry and VOC parameters.

3.2 OBSERVATION WELL INSTALLATION

3.2.1 General

Marathon Drilling Co. Ltd. of Ottawa, Ontario was retained by CRA to perform all the drilling activities and packer tests under the supervision of a CRA hydrogeologist. A technical representative of Golder Associates was also present during the majority of the drilling and packer testing activities. All field decisions with respect to screen placement were made jointly.

3.2.2 Drilling Activities

Boreholes were advanced utilizing a CME 55 track-mounted drill. It should be noted that access to the drilling locations was difficult due to the sharp changes in topographic relief as depicted on Drawing 1.

At the nested observation well locations (OW1A/OW1B-93 and OW2A/OW2B-93), the deeper bedrock borehole was advanced and cored first.

The overburden portion of each borehole was completed utilizing 95 mm (3 3/4-inch) inside diameter (ID) hollow-stem augers. Soil samples were retrieved every 1.5 m (5 feet) as the borehole was advanced utilizing 0.6 m (2 feet) long, split-spoon sampling techniques. All of the collected soil samples were inspected for the olfactory presence/absence of landfill impact. Following this inspection, the soil samples were described according to the Modified Unified Soil Classification System by the on-Site hydrogeologist and recorded on standard stratigraphic log forms. The stratigraphic logs for the individual boreholes are provided in Appendix C. The soil samples were then placed in mason jars labeled to indicate the job number, borehole number, sample number and date. All the mason jars were kept for geologic record and are currently stored at the City of Burlington geotechnical testing laboratory.

Following refusal, the augers were removed and a temporary 102 mm (4-inch) casing was set to refusal.

At each location, the bedrock was cored continuously utilizing diamond drilling techniques in 1.5 m (5 feet) intervals using an HQ size corebarrel to produce a 96.5 mm (3.78-inch) diameter hole. Air was used as the circulating medium during the coring activities. Each core run was placed in a core box and was visually inspected by the on-Site hydrogeologist in the field. Each core run was described to indicate lithology and structure. Close attention was given to the presence and nature of any fractures. Fracture distribution, orientation and spacing were recorded in standard stratigraphic log forms. Measurement of fracture aperture was not technically valid as core drilling and retrieval operations disturbed the fracture.

Rock quality designation (RQD) measurements were also conducted over the length of each core. The RQD measurements were performed by summing the total length of core recovered by counting only those pieces of hard and sound core which were 10 cm (4 inches) or greater in

length and dividing the sum by the total length of that run. A high RQD implies little fracturing while a low RQD implies a higher degree of predominately horizontal fracturing. It should be noted that during advancement of borehole OW2A-93 air bubbles were noted in the adjacent creek to a borehole depth of 9 m (30 ft). This indicates a degree of interconnectivity between the upper bedrock and the adjacent creek.

All core boxes were clearly labeled to indicate the following: job name, job number, borehole number, run number, and depth interval. All core boxes were temporarily covered with plastic sheeting and placed in a temporary storage on-site area. The core boxes are now stored in the City of Burlington geotechnical testing laboratory.

Based on the examination of the core, preferred zones were selected for the performance of packer tests.

3.2.3 Packer Testing Activities

Following the coring activities, preferred fractured zones were selected for the performance of packer tests. Packer tests were conducted by pumping water from the test interval.

A schematic diagram of the packer test assembly is illustrated on Figure 3.2. As shown on this figure the assembly consisted of two pneumatic rubber packers connected with an inflation line. The packers were inflated with compressed nitrogen. A submersible pump (Grunfos) was attached to the inflation line immediately above the lower packer. The length of the inflatable portion of each packer was 0.98 m (3.2 feet). The length of the submersible pump was 0.29 m (11.3 inches). The assembly was capable of isolating 1.5 m (5 feet) of corehole.

The packer test were conducted according to the following procedures:

1) All the coring tools were removed from the corehole;

2) The packer test assembly was lowered down the corehole and packer tests were performed at predetermined zones commencing at the bottom of the corehole. Packer tests at the lowermost part of the corehole were performed using one packer-assembly while the remaining packer tests were performed using a two packer (straddle) assembly.

3) Once the target zone was reached, the packers were inflated with nitrogen to a pressure ranging between 2758 and 3103 kPa (400 and 450 psi). A 1.5 m (5 ft) long zone was isolated during each packer test;

4) Once the packers were inflated to the desired pressure, the water level above the isolated zone was measured and recorded using an electronic (Solinst) water level indicator.

5) The packer tests were initiated by turning the Grunfos pump on to a frequency of approximately 220 Hz.

6) If the isolated interval was unable to produce water during the packer test, the packers were deflated to detect any malfunctions in the pump. In all cases water was discharged while the packers were deflated, thus indicating that the pump was operating correctly.

7) During each packer test, the water level above the isolated interval was measured periodically to detect leakage in the upper packer, if any. If leakage was detected (i.e.. continued decrease in water level), the packers were re-set and re-inflated.

8) Any resultant flow rate was measured using a calibrated 2-imperial gallon bucket and a stop watch.

9) The water discharged from the isolated interval was tested in the field by collecting a sample and measuring its conductivity, salinity and temperature with an electronic portable conductivity meter (Fisher Model 152).

10) Following the completion of a packer test, the packers were deflated and the assembly was placed opposite the next pre-determined interval. The packers were then inflated and procedure outlined above was repeated.

The results of the packer tests are summarized in Table 3.1 and the individual packer test field notes are provided in Appendix C.

3.2.4 Observation Well Installation

Following the selection of a monitoring zone based on the results of the packer tests, an observation well was installed in the borehole. The criteria for the selection of a monitoring zone also included the perceived ability of a fracture zone identified during logging of the core to produce water at a measurable rate. In addition to a recognition of depth, the selection of shallow and deep monitoring intervals was based on the observed conductivity and salinity contrast of the water discharged during the packer test. That lower portion of the corehole not instrumented was backfilled with bentonite pellets and overlain with silica sand prior to screen placement.

Each observation well consisted of a 50 mm (2-inch) diameter pre-cleaned, stainless steel screen 1.5 m (5 foot) in length threaded to stainless steel casing. Following placement of the screen and casing, the borehole was backfilled with an inert silica sand pack to a depth of 0.6 m (2 ft) above the top of the screen. For the shallow installations, the remainder of the borehole was filled with bentonite pellets to 0.6 m (2 feet) below ground surface. For the deep installations, a 0.6 m (2 feet) thick bentonite pellet seal was placed on top of the sand pack and bentonite grout was placed with a tremie pipe to 0.6 (2 feet) below ground surface.

A lockable steel protective casing was installed at each location in at least 0.6 m (2 feet) of concrete. Each observation well was labeled with a unique well number. The specific observation well installation

details are summarized in Table 3.2 and the individual stratigraphic and instrumentation logs are provided in Appendix D.

3.2.5 Gas Probe Installation

Following the installation of the groundwater observation wells, gas probes GP1-93, GP2-93 and GP3-93, were installed adjacent to observation well OW2A/OW2B-93, OW4-93 and OW3-93, respectively. The gas probes were installed in the unsaturated overburden in separate boreholes.

Each borehole was advanced in the overburden to the target depth utilizing 95 mm (3 3/4-inch) ID hollow-stem augers.

Each gas probe consisted of 12.7 mm (1/2-inch) diameter perforated PVC pipe 1.2 m (4 feet) or 0.9 m (3 feet) coupled to PVC pipe. Each gas probe was completed with a stopcock mechanism to facilitate methane gas monitoring. An inert silica sand pack was placed around the perforated section of the gas probe. A bentonite pellet seal at least 0.6 m (2 feet) thick was then placed on top of the sand pack.

A lockable steel protective casing was installed at each gas probe location in at least 0.6 m (2 feet) of concrete. Each gas probe was labeled with a unique identification number.

The specific gas probe installation details are summarized in Table 3.3 and the individual instrumentation logs are provided in Appendix D.

3.2.6 Groundwater Elevation Measurement

All newly installed observation well locations were surveyed by CRA personnel with reference to a City of Burlington geodetic survey monuments 001653088 (Elevation 171.487 m) and 001653087 (Elevation

143.828 m) to establish horizontal and vertical control. Groundwater elevations have subsequently been measured on four occasions and are presented in Table 3.4.

3.2.7 Gas Probe Measurement

Gas probe methane gas measurements were collected by CRA on two occasions, March 25 and April 7, 1993. These results are summarized in Table 3.5. Groundwater levels within the gas probes were not monitored as part of these two events. Golder Associates reported that flooding of the gas probes occurred during the spring melt period. It should further be noted that Golder Associates has conducted a more frequent measurement of these gas probe locations as part of the Jannock study to address MOEE Policy 07-07 provisions.

3.2.8 Well Development

Prior to the initial sampling event each newly installed observation well was developed. Where possible, a minimum of ten well casing volumes were removed on March 25, 1993 prior to the next days sampling event. Generally, temperature, pH and conductivity were measured after removal of two well casing volumes to demonstrate hydraulic and chemical stability. Observation well OW4-93 was slow to recharge, as such, only four casing well volumes were removed. Furthermore, observation well OW1A-93 went dry after approximately one casing volume was removed. Again where possible, a further 3 well casing volumes was removed just prior to the March 26th sampling event.

On April 6, 1993 prior to the second sampling event all newly installed observation wells were again further developed. One to ten well casing volumes were removed. Field temperature, pH and conductivity were recorded after the last volume was purged. A complete well development summary is presented in Table 3.6.

3.2.9 Sampling Program

On March 26, 1993 groundwater samples were collected from each newly observation wells (OW1A/1B-93, OW2A/2B-93, OW3-93 and OW4-93). On April 6 and April 7, 1993 one synoptic round of groundwater, leachate and surface water samples were collected, at all current (1993) and proposed, site surface water, groundwater and leachate monitoring locations.

The analysis of the above noted surface water, leachate and groundwater samples was conducted for selected general chemistry, volatile organic compounds (VOC) consistent with the current 1993/1994 site monitoring specifications. The general chemistry and VOC results for all newly installed proposed groundwater, and proposed surface water locations are provided in Tables 3.7A, 3.7B, 3.8A and 3.8B. Whereas the historical and current 1993 site monitoring results are provided in Appendix E.

3.2.10 Sampling Event Quality Assurance and Quality Control

The March 26th, 1993 and April 6th/7th, 1993 sampling event as well as July and October 1993 sampling event Analytical Assessment and Validation Reports are provided in Appendix F. The validation reports indicate that five analytical results required qualifications in 1993: one qualification for April data, no qualifications for July results and four qualifications for October. In April, the trace amount of bis-2-ethyl hexyl phthalate detected at MH15 was qualified. In October, aluminum and vanadium results for MH15 were qualified based on field blank contamination, while iron and zinc results for the field blank were qualified based on lab blank contamination. No substantive data qualifications are required based on the review of above assessment and validation reports, as such the analytical data generated is deemed acceptable for use.

4.0 SITE HYDROGEOLOGY AND GEOCHEMISTRY

4.1 HYDROGEOLOGIC BACKGROUND

As previously outlined, the Bayview Landfill Site lies adjacent to lands formerly owned by National Sewer Pipe (NSP) which were designated as "Site F" by the Region of Halton for the purpose of the landfill site selection process. To the west of Bayview Landfill lies the closed Region of Halton Burlington Landfill Site (BLF). A number of hydrogeological reports addressing Site F, the adjacent BLF, and the Bayview Landfill were presented as part of the Hearing for a proposed regional landfill site (Morrison Beatty 1980, Dillon 1982, Hewetson 1985, Trow 1986, Geocon 1987, CRA 1988a, Feenstra 1988 and Gartner Lee 1988). The University of Waterloo (Hewetson), Trow Hydrology Consultants and Morrison Beatty have all previously conducted hydrogeologic investigations on Site F. The approximate location of each respective previous investigative observation well is shown on Drawing 1.

A discussion of the hydrogeologic regime within Site F is summarized on pages 83 to 107 within the Reasons for Decision and Decision, dated February 24, 1989, in the matter of an application by the Regional Municipality of Halton for, amongst other considerations, landfilling at Site F within the City of Burlington. A copy of this portion of the decision is included in Appendix G.

In summarizing the above noted reports and decision, the site hydrogeology was characterized by a weathered and fractured shale mantle overlying a less fractured and relatively lower permeable shale bedrock. The fracture pattern within this shale mantle displays considerable variation both vertically and laterally across the site. The pattern of groundwater flow within this fractured shale mantle was expected to be complex. The active flow system was characterized by relatively low chloride concentrations (<2,000 mg/L) found at the Site. The active flow system varies from as much as 20 m thick at monitoring well nests HC4-85 to 0 m at HC8-85. In general however, this system varies from 0 to 5 m in thickness downgradient (south) from the Site. Groundwater in this shallow relatively

active system generally flows laterally through a complex network of interconnected fractures.

The underlying deep groundwater flow system was characterized by strong downward gradients and saline groundwaters. Chloride levels commonly exceed 10,000 mg/L in this system.

A number of well nests and pumping wells were installed on behalf of the Region of Halton by Trow (1986) during the course of the hydrogeologic investigations on Site F. Of these Trow monitoring wells, HC4-85, HC9-85, PW1 and PW3 lie generally downgradient of the Site and were incorporated into the 1988 and subsequent Site Monitoring Programs. In addition, well nests HC6-85 and HC7-85, which also lie generally downgradient of the Site, were incorporated into the 1989 and subsequent Monitoring Programs. It should be noted that well nest HC6 was reported to be damaged and unuseable in 1990 where as HC4-3 was reported as being damaged and unuseable in April 1994.

4.2 SURFACE WATER QUALITY BACKGROUND

Historical leachate seepage has been controlled through the installation of a leachate collection system resulting in a noticeable improvement of surface water quality since 1986.

The upstream surface water quality as demonstrated through review of the historical results of the monitoring program since 1986, indicates the occurrence of generally poor surface water quality within Indian Creek. The poor upstream surface water quality is currently reflected in relatively high levels of fecal and total coliform bacteria.

4.3 LEACHATE SOURCE CHARACTERIZATION

The current and historical Site monitoring program has involved the comprehensive characterization of leachate quality. All

leachate quality analytical results are provided in Appendix E. Leachate samples have been variously collected and analyzed from the six on-site leachate well locations and from Leachate Collection System Manhole 13 and Manhole 15 on at least 26 occasions as of January 1993. Collected leachate samples have been analyzed for General Chemistry, Bacteriological, Metals, Volatile Organic Compounds (VOCs), Base Neutral Acid Extractables (BNAEs), Pesticides and Polychlorinated Biphenyls (PCBs), analytes.

A site leachate source characterization of persistently detected analytes is provided on Table 4.1.

Review of Table 4.1 indicates that leachate quality may be characterized as a low strength leachate typical of a closed (20 plus years) municipal landfill. The average detected chloride concentration ranges from 612 to 1219 mg/L. The 612 mg/L chloride concentration is a representative average of both available leachate well quality and leachate collection system quality. This value (612 mg/L) may also be partially representative of the effects of groundwater dilution of the collected leachate. The 1219 mg/L chloride concentration is a representative average of available leachate well quality from 1986 to 1988.

The representative average concentration of the following compounds is also presented on Table 4.1;

Ammonia Nitrogen	49 mg/L
Kjeldahl Nitrogen	73 mg/L
Phenols	6.6 mg/L

Of particular note are the representative average concentrations of detected volatile organic compounds which have been used as indicator parameters in order to quantify historical groundwater and surface water impacts. These representative volatile organic compound average leachate concentrations are as follows:

Chlorobenzene	21.6 µg/L
1,4 - Dichlorobenzene	6.0 µg/L
Benzene	18.2 µg/L
Toluene	5.0 µg/L

It should also be noted that as of January 1993 while leachate samples have been variously collected on twenty-six occasions, toluene and benzene were detected on only six and eight occasions respectively. Chlorobenzene and 1,4 Dichlorobenzene were detected on 14 and 18 occasions respectively. The above leachate characterization demonstrates that any potential leachate impacts on groundwater and surface water are expected to be relatively minor given the apparent low strength "weak", leachate characteristics.

4.4 HISTORICAL AND CURRENT RESULTS COMPARISON

4.4.1 Hydrogeology

The hydrogeologic system as defined by the hydraulic and geologic information gathered as part of the monitoring and installation of observation wells OW1A, B-93 through to OW4-93 is generally consistent with the previous understanding of the aerial hydrogeologic regime.

Active shallow groundwater flow is predominantly topographically controlled within the upper 6 to 9 m of the underlying weathered/fractured bedrock. Horizontal hydraulic gradients within the shallow active bedrock flow system, as measured between OW4-93 and OW2B-93, are in the order of 0.03 to 0.04. This contrasts with the measured relatively strong downward vertical gradients between the shallow active bedrock flow system and the relatively deeper inactive flow system. These strong downward vertical gradients range between 1.30 and 1.45 as determined at observation well nest OW1A and OW1B-93.

These calculated strong downward vertical hydraulic gradients, between the shallow active and the relatively deep inactive flow

system, inturn contrast with measured downward vertical gradients of 0.04 to 0.11 at shallow active flow system well nest OW2A-93 and OW2B-93. The calculated vertical gradients within the shallow system are similar to the calculated horizontal gradient of 0.03 to 0.04.

While vertical gradients between the deep and shallow system are much greater as compared with those observed shallow system horizontal gradients, it is expected that the majority of groundwater flow through fractures will be lateral with local discharge to surface water, at topographic lows. The majority of groundwater flows occurs horizontally through fractures due to the higher horizontal permeability in the shale as compared to the vertical permeability.

This premise is supported by the observed presence of groundwater seeps along the incised channels of Indian Creek and the degree of fracture interconnectivity observed during the drilling of OW2A-93. The relatively high sustained packer test flow rates, as presented on Table 3.3, in the order of 7 L/min (1.5 igpm) for the shallow active system, further support the principal of predominantly horizontal groundwater flux. No measurable sustained groundwater flows were recorded during the packer testing of the deeper relatively inactive flow system.

The above flow system discussion supports the need for and effectiveness of the existing leachate collection system in controlling leachate migration.

4.4.2 Geochemistry

4.4.2.1 Groundwater

A summary of the two rounds of general chemistry results for each newly installed observation well is provided on Table 3.7A.

Review of this table, coupled with the knowledge that each well has been positioned within the intersected fracture zones of

comparatively higher measured groundwater flow, suggests that these wells are screened appropriately and are therefore capable of monitoring the performance of the Bayview Park Landfill Site.

As demonstrated by the measured chloride concentration of in most cases <100 mg/L, the following observation wells monitor the shallow active flow system.

	Chloride Concentration (mg/L)	
Observation Well	*March*	*April*
OW1B-93	1150	936
OW2A-93	370	78.5
OW2B-93	96	68.9
OW3-93	71/73	49.8
OW4-93	112	32.6

These initial, relatively low levels of chloride suggest that there is no deleterious groundwater impact downgradient of the Bayview Park landfill and that the leachate collection system is effective in controlling off Site leachate migration within groundwater. It is noted that chloride trends as well as trends in other selected parameters will be used to evaluate the performance of the landfill and the leachate collection system.

The relatively lower concentrations measured for samples collected in April likely reflect snow melt contributions which occurred between the March and April sampling events. These relatively low chloride concentrations are indicative of the meteorological contributions and reflect the relatively short residence time within the shallow bedrock.

The measured chloride concentrations of 5780 to 5994 mg/L at observation well OW1A-93 are indicative of the relatively inactive deeper bedrock flow system.

It is anticipated that then once the above shallow flow system chloride trends are further confirmed, chloride changes within these shallow downgradient observation wells may be demonstrated to be of

landfill origin. If this occurs, this impact would likely be as a result of leachate collection system failure. It is however, recommended that sodium and potassium be added to the proposed rationalized monitoring program analytical list so that major ions ratio plots may be constructed to help verify any apparent mixing of leachate with groundwater and surface water.

Review of Table 3.7B, which presents a summary of Volatile Organic Compound Results for each the newly installed observation wells, indicates the persistent presence of chlorobenzene for samples collected OW4-93 which is therefore interpreted to be landfill derived. These detected occurrences range from 63.3 µg/L in March to 11 µg/L in April. The current January 1994 MOEE ODWO for chlorobenzene (monochlorobenzene) is 80 µg/l. Trace levels (0.2 to 1.6 µg/l) of 1,4 dichlorobenzene were detected at OW2B-93 and OW4-93 respectively as part of the March sampling event. Levels of less than <1.0 µg/l of 1,4 dichlorobenzene were detected as part of April sampling event at these same locations.

The relatively low level detected benzene, ethyl benzene, xylene and toluene within both the inactive and active flow system observation wells as part of the March sampling event are likely to be representative of natural bedrock quality. The significance of these BTEX detections will be further evaluated with the aid of additional water quality collected during any future monitoring events.

4.4.2.2 Surface Water

The surface water General Chemistry April 1993 results for representative surface water monitoring locations are presented in Table 4.2. The surface water locations are presented on Figure 3.1 and Drawing No. 1. Historical surface water monitoring locations and 1993 synoptic surface with monitoring results are presented in Appendix E.

As depicted in Table 4.2 the following similar comparison of measured surface water quality at SW9-87 and SW9A-93 indicate that they are both representative of background quality.

Parameter	*April 1993 Results (mg/L) SW9-87*	*SW9A-93*
Field Temperature	7°C	8°C
Field pH	7.99	8.29
Field Conductivity (µmhos/cm)	460	360
Alkalinity	258	239
Chloride	5.02	6.81
Sulphate	95.1	59.1
Ammonia	<0.03	<0.03
Un-ionized Ammonia	0.00054	0.0017
TKN	0.16	0.96
Phenols (µg/L)	<1.0	<1.0

A comparison of upstream and downstream and proposed surface water sampling locations is presented in Table 4.2. Un-ionized ammonia concentrations were calculated utilizing Table 1 of the Water Management Goals, Policies and Objectives and Implementation Procedures of the Ministry of the Environment (revised May 1984). The field measured pH and temperature values were rounded up to allow for a direct and conservative utilization of Table 1.

A review of Table 4.2 indicates that the landfill is not a measureable source of total or fecal coliforms in surface water as landfill vicinity concentrations are less than upstream and downstream levels.

The leachate collection system is performing as designed and there were no observed lechate seeps in 1993..

Natural groundwater discharge into surface water may cause elevated levels of inorganic parameters including chloride, therefore, landfill impacts would be difficult to determine based only on inorganic parameters. As shown in Table 3.8B and in Appendix E no persistent levels of VOCs have been detected at any proposed or current surface water monitoring location since installation of the leachate collection system.

However, as shown on Table 4.2 the landfill appears having a minor effect on surface water quality with respect to increased chloride and to a similar extent ammonia (including un-ionized ammonia) or TKN concentrations at landfill vicinity surface water monitoring locations as compared to upstream and downstream monitoring points. Un-ionized ammonia concentrations are below Provincial Water Quality Objectives of 0.020 mg/L, at all surface water locations with the exception of SW14-93 and SW7-87 for the April sampling event. The unionized ammonia concentration measured at SW7-87 as part of the July 1993 monitoring event is calculated to be 0.0033 utilizing a field temperature of 20°C, a field pH of 8.5 and an ammonia nitrogen concentration of <0.03 mg/l.

Proposed surface water monitoring locations SW9A-93, SW13-93, SW14-93 and SW15-93 effectively demonstrate the appropriateness of these locations as compared with their upstream or downstream counterparts as they show both show similar levels of measured parameters.

4.5 SUMMARY

The above discussions demonstrate that recently installed observation wells are appropriately screened, and the proposed surface water locations are positioned effectively, to monitor with time the environmental performance of the Bayview Park Landfill.

5.0 CURRENT AND ANTICIPATED SITE ENVIRONMENTAL IMPACT

The previously documented occurrence of the relatively "weak" leachate at Bayview Park coupled with the proven performance of the leachate collection system suggest that potential groundwater and surface water impacts will be minimal. The groundwater and surface water resource is not a public or private water supply. The surface water quality, while it has been minimally impacted, is already of poor quality and as discussed below, analyzed Provincial Water Quality Objectives are largely met for samples collected at the proposed Buffer Zone boundary.

5.1 GROUNDWATER

Only trace to low levels of chlorinated volatile organic compounds at concentrations less than the Ontario Drinking Water Objectives were detected within downgradient monitoring wells during this work program. Consequently, it is considered that there is no current defined groundwater impact downgradient of the Bayview Park Landfill. It is anticipated that the continued operation of the leachate collection system will mitigate any landfill derived groundwater contamination. As previously stated, once shallow flow system chloride trends are further confirmed, significant increased chloride concentrations within these shallow downgradient observation wells would likely signify landfill derived impact (barring any other sources). The presence of chlorinated volatile organic compounds are also considered as diagnostic indicators of landfill derived groundwater impact.

5.2 SURFACE WATER

The leachate collection system has been effective in the control of overland leachate seepage. No persistent chlorinated volatile organic compounds have been detected within the surface water monitoring locations since the installation of the leachate collection system. As presented on Table 4.2, there is currently minor surface water quality impact

downstream of the Bayview Park Landfill Site as shown by increased concentrations of ammonia nitrogen, chloride, and/or TKN between upstream and downstream monitoring locations (SW9A-93 and SW13-93, SW11-87 through SW5-87 and SW10-87, SW14-93 through SW7-87 and SW15-83 through SW8-87). The un-ionized ammonia concentration at SW13-93 for the specified pH and temperature at the time of sampling is calculated as 0.0039 which is less that the Provincial Water Quality Objective for un-ionized ammonia of 0.02 mg/L. There is no surface water criteria for chloride. It should be further noted that natural groundwater discharge to surface water may cause elevated levels of inorganic parameters including chloride.

Un-ionized ammonia concentration in excess of the provincial water quality objective were detected at both SW14-93 and SW7-89 as part of the April 1993 sampling event. Un-ionized ammonia concentrations at SW7 were below the provincial water quality objective as part of the July sampling event. Upstream concentrations of total and fecal collifom at SW11-87, SW9-87 and SW9A-93 are the result of an upgradient source of these parameters. It is recommended that E.coli bacteria be analyzed in order to further define the source fecal pollution. E. coli is normally found in the intestines of warm blooded animals and its detection provides a definite evidence of fecal pollution. Fecal coliforms can be found in environmental samples such as food wastes which have not been contaminated by fecal pollution.

The continued operation and maintenance of the leachate collection system should be continued control historical leachate seepage and prevent adverse surface water quality impairment.

6.0 CONTINGENCY MEASURES

6.1 LEACHATE COLLECTION SYSTEM MAINTENANCE

It is anticipated that an access road will be constructed to facilitate leachate collection system maintenance and repair. A formalized leachate collection system and leachate seep inspection program will be also implemented as part of the site monitoring plan discussed in Section 8.0.

6.2 CONTINGENCY OPTIONS

If unacceptable groundwater/surface water impact is occurring from leachate egress the following contingency options are available:

i) upgrade of the leachate collection system to control the presence of persistent, previously unobserved, leachate seepage; and/or
ii) installation of a shallow purge well(s) located within the Buffer Zone.

This contingency option would likely involve the discharge of collected groundwater to the sanitary sewer system which would allow for ultimate treatment at the Skyway Wastewater Treatment Plant.

7.0 BUFFER/ATTENUATION ZONE REQUIREMENTS

The COB and Jannock have reviewed the current and anticipated site conditions and have agreed in concept that the appropriate Buffer/Attenuation Zone land requirements are as shown on Drawing 1 and Figure 3.1. The Buffer/Attenuation Zone would be used for the following purposes:

1) surface water and groundwater monitoring, landfill gas monitoring, adjacent to the landfill and at Buffer Zone boundaries;

2) sufficient room to implement contingency measures for remediation of any unacceptable impact to surface water and groundwater as measured at the boundary of the Buffer Zone; and

3) Ease of access for COB to the landfill leachate collection system for maintenance/inspection purposes.

It is proposed that nested observation wells (shallow and deep) installed at locations OW1A,1B-93 and OW2A,2B-93 to monitor the performance of the landfill at the edge of the proposed Buffer/Attenuation Zone. In addition it is also proposed that three shallow observation wells (OW3-93, PW-3 and OW4-93) also be used to monitor the active groundwater flow zone along the buffer zone boundary. It should be noted that pumping well PW-3 was previously installed by Hydrogeology Consultants and has been part of the Site annual monitoring program since 1988. Surface water monitoring will also be undertaken within the Buffer Zone and along existing perimeter Road allowances.

The Buffer/Attenuation Zone will allow for the attenuation of landfill-derived contaminants and would provide boundary impact monitoring capabilities. As previously stated, this downgradient Buffer Zone would also allow the COB to repair the Leachate Collection System and implement contingency measures as, and if, required.

It is anticipated that the COB would own the subject buffer lands. In large part, the southern boundary approximates the limit of a regionally recognized Oak-Hickory forest complex. This portion of the forest would therefore be preserved.

8.0 RATIONALIZED MONITORING PROGRAM

The Rationalized Monitoring Program's Primary Purpose will be to monitor the effectiveness of the leachate collection system, especially in regard to monitoring the magnitude (if any) of leachate seep derived surface water impacts and ensure no unacceptable groundwater impacts are occurring at the proposed buffer zone boundary. It will also confirm that landfill derived impacts have not and will not occur off property.

The rationalized groundwater program provides an indication of shallow active and deep flow system groundwater quality downgradient of the landfill site. As such, it provides verification that the site is performing as expected and that no unacceptable groundwater impacts are occurring. Upstream, landfill vicinity and downstream surface water quality are also to be monitored to document the presence, if any, of landfill derived contamination.

It is anticipated that all future groundwater and surface water monitoring will be undertaken within the Buffer Zone and along the adjacent road allowances, twice annually (March and July).

The rationalized Monitoring Program is presented on Table 8.1.

The Rationalized Monitoring Program is proposed at this time to be similar to that previously undertaken at the Site with the following exceptions:

i) background surface water monitoring locations SW9-87 and SW12-87 will be deleted from the annual monitoring program as they are located on lands not owned by the COB;

ii) As shown on Drawing 1 and Figure 3.1, surface water location SW9-87 will be replaced by SW9A-93 which will then approximate background surface water quality entering the Buffer Zone;

iii) Downstream surface water locations SW4-87, SW6-87, SW7-87, SW8-87, SW10-87; and SW13-87 will also be deleted from the annual monitoring program. Proposed downstream boundary surface water monitoring locations SW13-92, SW14-92 and SW15-92 will effectively monitor and replace these locations. Flow measurements will be conducted at locations SW9A-93, SW13-93 and SW14-94;

iv) Three shallow monitors (OW3-93, OW4-93 and PW3) as shown on Drawing 1 and Figure 3.1 will be utilized to monitor shallow active groundwater quality downgradient of the leachate collection system;

v) The downgradient water quality in both the shallow and deep bedrock systems will be monitored at observation well nests OW1A/1B-93 and OW2A/2B-93;

vi) A review of the appropriateness of the current analytical parameter list has been undertaken as part of this rationalized monitoring program given the significant historical database, especially in regards to leachate quality given that the site is a closed facility. As such, it is recommended that pesticide and PCB leachate analysis be deleted from the site monitoring program. Pesticides and PCBs have never been detected within the leachate. Continued monitoring of leachate quality for metals, selected VOCs, oil and grease, and Bis-2-ethylhexyl phthalate on an annual basis is largely necessary to demonstrate both compliance with Region of Halton Sewer Use Bylaw and to enhance site leachate characterization;

vii) It is proposed that phenols and sulphate be deleted from the surface water and groundwater analytical lists. Potassium and sodium have been added to these analytical lists so that a major ion ratio plots may be constructed to verify if significant mixing of leachate and groundwater has occurred. Persistently detected elevated chloride and chlorinated organic compounds at shallow active monitoring locations will be primarily utilized to gauge site impacts.

viii) It is recommended that surface water samples also be analyzed for E-coli bacteria as it is a more definitive, MOEE recognized test for, fecal pollution.

ix) Leachate well monitoring in the form of liquid levels and leachate collection system quality determinations is to be conducted to monitor leachate collection system performance and to characterize the source of potential contamination;

x) Leachate seep inspections will also be conducted at all historical leachate seep locations in order that the satisfactory performance of the leachate collection system is demonstrated;

xi) Landfill gas monitoring will be conducted two times annually at each of the three gas probe (GP1-93, GP2-93 and GP3-93) monitoring locations;

xii) It is anticipated that all previously existing observation wells on C of B property be abandoned in a manner consistent with Ontario Regulation 903 s21; and

The results of the above annual monitoring program will be reported on March 1st of the following year as per condition 4 of Provisional Certificate of Approval No. 210103.

9.0 SUMMARY

This report documents the need for a rationalized monitoring program and proposed buffer/attenuation zone for the Bayview Park Landfill. This technical review has been developed jointly between the COB and Jannock such that the COB will have responsibility, and effective control of the landfill and adjacent Buffer Zone lands and Jannock can proceed independent of landfill issues with the possible development of these adjacent lands beyond the Buffer Zone.

The MOEE is asked to approve the rationalized monitoring program and proposed Buffer Zone before the rationalized program can be implemented. Discussions should also be initiated to discuss any amendments to the C of A which may be appropriate to reflect the legal definition of the site given the addition of downgradient buffer/attenuation lands.

All of Which is Respectfully Submitted,
CONESTOGA-ROVERS & ASSOCIATES

ENVIRONMENTAL PERFORMANCE REPORT
BAYVIEW PARK LANDFILL SITE

Volatile Organic Compounds	*Concentration Range (µg/L)*	*Selected Parameter Average Detected Concentration(1) (mg/L)*
Chlorobenzene	<0.5 - 299*	21.6
1,4-Dichlorobenzene	<1.0 - 58.2	6.0
Benzene	<0.5 - 48.4	18.2
Toluene	<0.5 - 12.4	5.0
Pesticide and PCBs		
No pesticide or PCB analytes have been persistently detected	--/--	
Base Neutral and Acid Extractables		
Bis (2-ethylhexyl) Phthalate	<0.5 - 137 (3)	
Bacteriological Testing	***Concentration Range (100 ml)***	
Fecal Coliform	<1 - 800	
Fecal Streptococci	<1 - 650	
Total Coliform	<1 --63000*	

Notes:

(1) - Average concentration with anomalously high values not accounted for in average.
* - Anomalously high value.

(2) - 612 mg/L chloride is representative average of both leachate well quality (1986 to 1988) and leachate collection system quality (1986 to 1993).
- 1219 mg/L chloride is representative average of available leachate well quality (1986 to 1988),

(3) - <0.5 µg/L is representative of recently detected concentrations of Bis (2 ethylhexyl) Phthalate.

(4) - General Chemistry and metals Analytical results are presented in mg/L unless noted otherwise.

TABLE 8.1

PROPOSED SITE MONITORING SPECIFICATION
ENVIRONMENTAL PERFORMANCE REPORT
BAYVIEW PARK LANDFILL

1.0 SURFACE WATER MONITORING

1.1 Locations: 8 Surface water;

Upstream:	SW9A-93, SW11-87
Landfill Vicinity:	SW1-87, SW3-87, SW5-87
Downstream:	SW13-93, SW14-93, SW15-93

1.2 Monitoring Frequency:

Semiannually: March, (wet weather sampling)
July (dry weather sampling)

1.3 Types of Monitoring

1. measure flow rate accurately at SW9A-93, SW13-93, SW14-93 and SW15 -93 location using flow meter and record as L/sec or gpm

2. sampling:

VOCs	EPA List 624 + xylenes
General Chemistry	field pH, field conductivity, field temperature, alkalinity, chloride, sodium, potassium, TKN, ammonia-N,
Bacteria	total coliforms, fecal coliforms, fecal streptococci and E.coli

PROPOSED SITE MONITORING SPECIFICATION
ENVIRONMENTAL PERFORMANCE REPORT
BAYVIEW PARK LANDFILL

2.0 GROUNDWATER MONITORING

2.1 LOCATIONS

7 Buffer Zone Observation Wells	PW3, OW1A-93, OW1B-93, OW2A-93, OW2B-93, OW3-93, OW4-93

2.2 Monitoring Frequency:

March and **July**

2.3 Types of Monitoring

i) measure well depth and water level at each well

ii) all observations well locations purged at least 10 well casing volumes or dry prior to sampling.

- sample PW3, OW1B-93, OW2A-93, OW2B-93, OW3-93 and OW4-93, after purging, for both VOCs and general chemistry

iii) Sampling: General Chemistry — field pH, field conductivity, alkalinity, TKN, ammonia-N, chloride, sodium, potassium

VOCs — EPA List 624 + xylenes (above six locations only)

2.4

TABLE 8.1

PROPOSED SITE MONITORING SPECIFICATION
ENVIRONMENTAL PERFORMANCE REPORT
BAYVIEW PARK LANDFILL

3.0 LEACHATE WELL MONITORING

3.1 Location: 6 Leachate Wells LW1, LW2, LW3, LW4, LW5, LW6

3.2 Monitoring Frequency:

Twice per year: **March** and **July**

3.3 Types of Monitoring

1. measure depth with plopper (sound) each leachate well
2. monitor and record leachate level in each well

4.0 LEACHATE COLLECTION SYSTEM MONITORING

4.1 Location: 1 Manhole MH15

4.2 Monitoring Frequency:

Once per year for **leachate quality at MH15**: March

4.3 Types of Monitoring

i) Sampling (at MH15):

General chemistry	see attached parameter list, includes Field pH, Field Conductivity, Field Temperature
Metals & Cyanide	
VOCs	
BNAEs	
Oil and Grease	

6.0 from the next page should be here

TABLE 8.1

PROPOSED SITE MONITORING SPECIFICATION
ENVIRONMENTAL PERFORMANCE REPORT
BAYVIEW PARK LANDFILL

5.0 LANDFILL GAS MONITORING

5.1 Locations: GP1-93, GP2-93 and GP3-93

5.1.1 Monitoring Frequency

Twice per year: **March** and **July**

5.1.2 Types of Monitoring

Measure and record gas levels. If groundwater is present within gas probes measure and record groundwater level prior to recording gas levels the next day.

6.0 LEACHATE SEEP AND LEACHATE COLLECTION SYSTEM INSPECTION

6.1 Locations: 9 Leachate Seeps LS1, LS2, LS3, LS4, LS5, LS6, LS7, LS8, LS9

6.2 Monitoring Frequency:

Twice per year: **March** and **July**

6.3 Types of Monitoring:

i) Identify and photograph any leachate seep that has re-occurred
ii) Estimate flow rate at the seep and report as L/sec or gpm
iii) Complete leachate seep inspection sheets
iv) Report any occurrences of leachate seeps or failure of leachate collection system.
v) It is noted that regular leachate inspections will also be conducted by City of Burlington staff. These reports will be documented and discussed in the annual monitoring report.

APPENDIX A

CERTIFICATE OF APPROVAL NO. 210103

LEACHATE COLLECTION SYSTEM

CERTIFICATE OF APPROVAL NO. 3-0819-86-007

Ontario Environment

NOTICE

ONTARIO MINISTRY OF THE ENVIRONMENT

JUL 17 1986

CENTRAL REGION
OAKVILLE OFFICE

TO: The Corporation of the
City of Burlington
P.O. Box 5013
426 Brant Street
Burlington, Ontario L7R 3Z6

ATTENTION: MS. HELEN MACRAE, CLERK

Take Notice that condition no. 1 of Provisional Certificate of Approval No. A 210103, dated October 11, 1973, is hereby revoked and replaced with the following conditions:

1. Prior to the excavation of any waste in connection with the construction of a leachate collection system approved under Certificate of Approval No. 3-0819-86-007, the City shall file with the Director of Central Region of the Ministry of the Environment (the Regional Director) plans and design details for the relocating and covering of the excavated waste and the recontouring of the site. No waste may be excavated or relocated without the approval of the Regional Director and except in accordance with such plans and design details.

2. All excavated waste shall be handled in accordance with the "Health and Safety Protocol" described in a letter from Greg Ferraro, P. Eng. of Conestoga-Rovers & Associates Limited, to Lyle Parsons of the Ministry dated July 14, 1986.

3. Surface improvements shall be completed in accordance with Section 8.0 of the "Detailed Design Report, Leachate Collection System and Surface Drainage Improvements" dated June 1986 and the "Contract Documents for Surface Drainage Improvements" and associated Plans 1 to 4 issued June 20, 1986.

4. The City shall carry out the monitoring and inspection program as approved by the Regional Director with such modifications as may be approved from time to time by the Regional Director. On or before March 1st of each year, the City shall file a report with the Regional Director containing an analysis and evaluation of the monitoring and inspection program for the previous year.

The reasons for the imposition of these conditions are as follows:

1. The reason for condition 1 is to ensure that the relocation of the waste is carried out in accordance with a defined protocol. Not doing so may create a nuisance and would not be in the public interest.

2. The reason for condition 2 is to protect the health and safety of persons involved in the relocation of the waste.

3. The reason for condition 3 is to reduce infiltration of surface water into the site, to eliminate exposed refuse which is creating a nuisance and to ensure proper control of the site.

4. The reason for condition 4 is to provide for the investigation of groundwater contamination in the area of the site and to ensure that the existing surface water contamination problem is abated by the installation of the leachate collection system.

You may by written notice served upon me and the Environmental Appeal Board within 15 days after receipt of this Notice, require a hearing by the Board.

This Notice should be served upon:

The Secretary
Environmental Appeal Board
1 St. Clair Avenue West
5th Floor
Toronto, Ontario M4V 1K7

AND

The Director
Section 38, E.P.A.
Ministry of the Environment

Whereas / *Attendu que*

THE CORPORATION OF THE CITY OF BURLINGTON

of / d

has applied in accordance with Section 24 of the Ontario Water Resources Act for approval of;
a fait, conformément à l'article 24 de la loi sur les ressources en eau de l'Ontario, une demande d'autorisation:

A new leachate collection, pumping and transmission system to collect and dispose of (into the City of Burlington's municipal sanitary sewer system) surface leachate and contaminated shallow groundwater from the closed Bayview Park sanitay landfill site bounded by King Road to the northeast and the upper reaches of Indian Creek to the southwest in the City of Burlington, consisting of a toe drain system located at the base of a ravine to the west of the landfill area running approximately 250 metres north of the landfill south property line, two pre-fabricated leachate collection sumps having twin (one duty and 1 standby), 1.5 and 2.0 KW explosion proof submersible type pumps, each pump being rated at:

Pump	Rated Head (m)	Rated Capacity (L/min)
3	17.4	225
3	19.9	200

together with all associated pump level controls, access hatch, electrical control panel internal sump piping, fittings and appurtenances as well as a 200 mm buried perforated PVC leachate collector header at each sump location and 50-75 mm diameter high density polyethylene collected leachate forcemains located along the south edge of the landfill fill area discharging to a 200 mm diameter leachate collection sewer and forcemain, the forcemain section of the sewer being located within the fill area of the landfill (southern edge) for a distance of 120 metres to a height of land with the gravity section of the leachate collection sewer continuing along the south side of the landfill to King Road a distance of 470 m. The sewer then turns south following the west ditch of King Road down to the North Service Road, a distance of approximately 590 metres. The gravity sewer then changes diameter to 450 mm and crosses under the North Service Road and Highway 403 at a point 20 m west of the King Road Overpass. The sewer crosses Highway 403 (a distance of 80 m) and then continues south for 127 metres on the west side of King Road to an existing 450 mm municipal sanitary sewer located on King Road, all in accordance with the documents listed in Schedule "A" (attached) at a total estimated cost, including engineering and contingencies, of EIGHT HUNDRED AND FIFTY THOUSAND DOLLARS ($850,000.00), subject to the following special terms and conditions considered necessary by the undersigned:

....2

Now therefore this is to certify that after due enquiry the said proposed works have been approved under Section 24 of the Ontario Water Resources Act.

Le présent document certifie qu'après vérification en bonne et due forme la construction dudit projet d'ouvrages a été approuvée aux termes de l'article 24 de la loi sur les ressources en eau de l'Ontario.

This Certificate supercedes Certificate of Approval No. 3-0819-86-006 issued at Toronto, on June 27, 1986.

has applied in accordance with Section 24 of the Ontario Water Resources Act for approval of:
a fait, conformément à l'article 24 de la loi sur les ressources en eau de l'Ontario, une demande d'autorisation:

SPECIAL TERMS AND CONDITIONS

1. Upon completion of the sewage works the Corporation of the City of Burlington shall supply the Ministry of the Environment, Environmental Approvals and Land Use Planning Branch with as-constructed drawings for the on-site works namely those works between Manhole No. 12 and Manhole No. 21, including all works located within the Bayview Park Landfill site boundary as shown on the engineering drawing entitled Bayview Park Landfill Leachate Collection System, General Layout, Drawing No. 06, Sheet 1 of 15, prepared by Conestoga-Rovers & Associates Limited dated April, 1986 revised as per addendum No. 1 and Change Order No. 1.

2. All liquids which require dewatering for any reason during construction of all on-site works between Manhole No. 12 and Manhole No. 21 as described in Condition No. 1 shall be discharged to a sanitary sewer. Written records of volumes of liquids dewatered shall be supplied to the MOE inspector upon request.

Now therefore this is to certify that after due enquiry the said proposed works have been approved under Section 24 of the Ontario Water Resources Act.
Le présent document certifie qu'après vérification en bonne et due forme la construction dudit projet d'ouvrages a été approuvée aux termes de l'article 24 de la loi sur les ressources en eau de l'Ontario.

NOTICE

TO: The Corporation of the City of Burlington
Box 5013
426 Brant Street
Burlington, Ontario
L7R 3Z6

You are hereby notified that a Conditional Certificate of Approval No. 3-0819-86-007 has been issued to you subject to the conditions outlined therein.

The reasons for the imposition of these conditions are as follows:

1. The filing of as-constructed drawings with the Ministry of the Environment, Environmental Approvals and Land Use Planning Branch is necessary to show that the sewage works were built in conformity with the approved documents listed as Schedule "A" in Certificate of Approval No. 3-0819-86-007 if any questions arise as to what was actually constructed.

2. Liquids from this site contain contaminants which may impair the quality of water in Indian Creek if discharged, contrary to Section 16 of the Act.

You may by written notice served upon me and the Environmental Appeal Board within 15 days after receipt of this Notice, require a hearing by the Board.

This Notice should be served upon:

The Secretary,
Environmental Appeal Board,
1 St. Clair Ave. West,
5th Floor,
Toronto, Ontario.
M4V 1K7

AND

The Director,
Section, 24, OWR Act,
Ministry of the Environment,
135 St. Clair Ave. West,
Toronto, Ontario.
M4V 1P5.

DATED at Toronto this 16th day of July , 19 86 .

Director,
Section,
Ministry of the Environment.

1771 (09/84)

SCHEDULE "A"

This Schedule "A" forms part of Certificate of Approval No. 3-0819-86-007 issued on July 16, 1986.

1. Detailed design drawings prepared by Conestoga-Rovers and Associates Limited, Consulting Engineers, issued June 23, 1986 and date stamped July 8, 1986 Environmental Approvals and Land Use Planning Branch entitled Bayview Park Landfill, Leachate Collection System, Contract No. 86-16.

2. Contract Specifications dated June, 1986 entitled City of Burlington, Bayview Landfill Site Leachate Collection System and Surface Drainage Improvements, Contract 86-16, File 760.04-2 (noted by MOE as a second submission).

3. A letter dated June 17, 1986 to Mr. Lyle Parsons from Greg Ferraro, P.Eng. entitled Addendum No. 1, Bayview Park Landfill, Leachate Collection System detailing changes to the Leachate Collection System, Contract 86-16.

4. A letter dated June 23, 1986 to Lyle Parsons, B.E.S. Systems Co-ordinator from Alan Ramsay, Environmental Management Co-ordinator, The Corporation of the City of Burlington, with attached Addendum No. 2, Bayview Park Landfill, Leachate Collection System detailing changes to the leachate pumping system, Contract 86-16.

5. Change Order No. 1 dated June 25, 1986 entitled Corporation of City of Burlington, Bayview Park Landfill, Leachate Collection System Contract 86-16, unsigned.

6. A letter dated June 26, 1986 to Mr. Lyle F. Parsons, B.E.S. Systems Co-ordinator from Greg Ferraro, P.Eng., entitled Change Order No. 1, City of Burlington, Bayview Park Landfill Leachate Collection Systems with attached Appendix A entitled PVC and HDPE Pipe Strength Calculations.

7. A letter dated July 4, 1986 to Mr. T. Armstrong, Acting Director Environmental Approvals and Land Use Planning Branch from Michael N. Boggs, Chief Administrative Officer entitled Bayview Park Landfill Site, Ontario Water Resources Act Application.

APPENDIX B

CURRENT 1994 MONITORING PROGRAM

BAYVIEW PARK LANDFILL SITE

CONESTOGA-ROVERS & ASSOCIATES
1994 SITE MONITORING SPECIFICATIONS

PROJECT: Bayview Park Landfill Site

PROJECT NO.: 1354-30

PROJECT MANAGER: Greg Ferraro

PROJECT COORDINATOR: Peter Hayes

MONITORING STAFF:		RESPONSIBILITY
	Roger Waller	Field Technician
	John Duda	Field Technician
	Rob Toth	Coordinator/Chemist QA/QC

LABORATORY USED: CAS, Novamann (Ontario) Ltd. (Mann)

AUTHORIZATION:	MONITORING EVENT	SIGNATURE	DATE
	April	_____	_____
	July	_____	_____
	October	_____	_____

MONITORING PROGRAM DESCRIPTION
- surface water monitoring Section 1.0
- leachate level monitoring Section 2.0
- leachate collection monitoring Section 3.0
- off-Site groundwater monitoring Section 4.0
- leachate seep inspection Section 5.0

SPECIAL INSTRUCTION
- January event: water levels only
- **April event:**
- July event:
- October event:

REVISION:	DATE	REVISION
	March 2, 1994	review April '94 for monitoring event

1.0 SURFACE WATER MONITORING

1.1 Locations: 12 surface water: SW1-87, SW3-87, SW4-87, SW5-87, SW6-87, SW7-87, SW8-87, SW9-87, SW10-87, SW11-87, SW12-87, SW13-88

sample locations	12
duplicates	1
field Blank	1
Total	14

(additional trip blank for VOCs)

1.2 Monitoring Frequency:

Semiannually: April, after significant rainfall (wet weather sampling) July (dry weather sampling), if July sampling event is dry then surface water samples will be collected in October

1.3 Types of Monitoring

1. measure flow rate accurately at each location using flow meter and record as L/sec or gpm

2. sampling:

VOCs	see Table A.1
General Chemistry	field pH, field conductivity, alkalinity, chloride, sulfate, TKN, ammonia-N,
	phenols
Bacteria	total coliforms, fecal coliforms, fecal streptococci

3. laboratory detection limit for ammonia must be less than 0.02mg/l

2.0 LEACHATE WELL MONITORING

2.1 Location: 6 Leachate Wells LW1, LW2, LW3, LW4, LW5, LW6

2.2 Monitoring Frequency:

Twice per year: April and July

2.3 Types of Monitoring

1. measure depth with plopper (sound) of each leachate well
2. monitor leachate level in each well

3.0 LEACHATE COLLECTION SYSTEM MONITORING

3.1 Location: 2 Manholes MH15 and MH14

Sample location	1 (MH15 only)
Field blank	1

(additional trip blank for VOCs in October only)

3.2 Monitoring Frequency:

Two times per year for leachate quality at MH15: April and October

3.3 Types of Monitoring

1. Sampling (at MH15):

General chemistry	see Table A.1, includes Field pH and Field Conductivity
Metals & Cyanide	see Table A.1
VOCs	see Table A.1
BNAEs	see Table A.1
Pesticides & PCBs	see Table A.1

NOTE: Attached parameter list (Table A.1) must be followed with no emissions.

4.0 OFF-SITE GROUNDWATER MONITORING

4.1 APRIL - WET WEATHER MONITORING EVENT

4.1.1 Locations:

11 Groundwater	PW1, PW3, HC4-2, HC4-3, HC4-4, HC6-2, HC6-3, HC7-1,HC7-2 HC9-2, HC9-3

General chemistry	
Sample locations	11
Duplicates	2 (one each of PW series and HC series)
Field Blank	1
Total	14
VOCs	
Sample locations	2 (PW1, PW3)
Duplicate	1
Total	3

4.1.2 Monitoring Frequency:

APRIL, after significant rainfall

4.1.3 Types of Monitoring

1. measure well depth and water level at each well

2. pump PW1 and PW3 for a minimum of 5 (five) hours (keck pump or well wizard purge pump may be used)

- sample PW1 and PW3, after pumping

3.	Sampling:	General Chemistry	field pH, field conductivity, alkalinity, TKN, ammonia-N, chloride
			phenol
		VOCs	see Table A.1 for VOC analyses

4.2 JULY - DRY WEATHER MONITORING EVENT

4.2.1 Locations:

11 Groundwater	PW1, PW3, HC4-2, HC4-3, HC4-4, HC6-2, HC6-3, HC7-1, HC7-2, HC9-2, HC9-3

General chemistry	
Sample locations	11
Duplicates	2 (one each of PW series and HC series)
Field Blank	1
Total	14

VOCs	
Sample locations	6 (2 PW series and 4 HC series wells)
Duplicate	2 (one each of PW series and HC series)
Field Blank	1
Total	9

4.2.2 Monitoring Frequency:

JULY, after significant dry period

4.2.3 Types of Monitoring

1. measure well depth and water level at each well

2. pump PW1 and PW3 for a minimum of 5 (five) hours (Keck pump or Well Wizard purge pump may be used)
   - sample PW1 and PW3 after pumping for VOCs and general chemistry

3. sample select HC series for VOCs, one well at each HC nest, wells to be sampled will be verified by Peter H. prior to monitoring event

4.	Sampling:	General Chemistry	field pH, field conductivity, alkalinity, TKN, ammonia-N, chloride
			phenol
		VOCs	see Table A.1 for VOC analyses

5.0 LEACHATE SEEP INSPECTION

5.1	Locations:	9 Leachate Seeps	LS1, LS2, LS3, LS4, LS5, LS6, LS7, LS8, LS9

5.2 Monitoring Frequency:

Four times per year: January, April, July and October

5.3 Types of Monitoring:

1. Identify and photograph any leachate seep that has re-occured
2. Estimate flow rate at the seep and report as L/sec or gpm
3. Complete leachate seep inspection sheets
4. Report any occurrences of leachate seeps immediately to Greg Ferraro or Peter Hayes.

6.0 BOTTLE REQUIREMENTS

Analytical Destination	Samples Analyzed	Test Parameters
a) April		
CAS	**30 X 1000 mL**	**General Chemistry**
	30 x 500 ml	**Phenols**

POW # 1 Deep (OW1A-93)

1354
FIELD FILE

Packer Test #1

Depth : 75 - 80 Ft bgs
Inflation pressure : 400 psi
Note : performed test with only one packer (upper)

Pumped for 2 minutes and noticed dropped in water level of 2.88m btoc to 3.01m btoc. Packer was leaking. Removed 2 gallons.

Packer Test #1 re-run.
same depth
same inflation pressure

Pumped for approximately 2 minutes. No water was pumped out of this interval. Water level did not change (2.89m btoc). Deflated the packers and pumped water out. Pump is working (about 220-240 Hz working range).

POW #1 Deep. (OW1A-93)

Packer Test #2

Depth: 65 - 70 ft bgs.
Inflation pressure: 400 psi

Pumped for 2 minutes twice. No water was pumped out of this interval. Water level did not change (3.51 m btoc). Deflated packers on both occasions and pumped water out. Pump is working.

Packer Test #2 re-adjusted packers

Depth: 67 - 72 ft bgs
Inflation pressure: 400 psi

Pumped for 2½ minutes. No water was pumped out of this interval. Water level (1.90 m btoc did not change). Deflated packers. Pumped water out so the pump was noted to be working.

POW # 1 Deep. (OW2A-93)

Packer Test #3

Depth: 56 - 61 Ft bgs
Inflation pressure: 400 psi

Pumped for 2 minutes. Water was not pumped from this interval. Water level at 1.90 m btoc did not change. Deflated packers and pumped water out. The pump was working.

Packer Test #4

Depth: 50 - 55 Ft bgs
Inflation pressure: 400 psi

Pumped for 2 minutes. No water was pumped out of this interval. Water level at 1.90 m btoc did not change. Packers were deflated. Pump was working.

POW 1 Deep (OW1A-93)

Packer Test # 5 : At the request of Jim Robinson (Golder's

Depth : 29- 34 ft bgs.
Inflation pressure : 400 psi

Sample # 1

POW # 1 Deep.

Based on visual examination of the core to select the deep screened interval at POW 1 location the following were noted:

50 - 55 ft. → no water-bearing fractures
55 - 60 ft → fracture zone 58.9 - 59.3 ft.
60 - 65 ft → no water-bearing fractures
65 - 70 ft → 68.3 - 68.5 ft fracture zone
70 - 75 ft → no water-bearing fractures
75 - 80 ft → no water-bearing fractures
35 - 50 ft → no major water-bearing fractures
30 - 35 ft → major water-bearing fracture
25 - 30 ft → water-bearing fracture

Note 20 - 25 ft → made water.

Based on above selected: 55 - 60 ft interval } to perform
65 - 70 " " } packer tests.

LEGEND (MOE Obj.: Ontario Surface Water or Groundwater Objectives, revised July 1993)

J - The associated value is an estimated quantity.
U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.
-- - The parameter was not analyzed.
ND - The material was analyzed, but not detected above an unstated method detection limit.
TR - Trace level detection.
< - Indicates result less than that shown.
> - Indicates result greater than that shown.
R - The data was not useable.
NS - Insufficient sample.
p - Proposed MOE Surface Water Objective.
* - for PH >6.5 to 9.0
*** - a) Cadmium-0.15 ug/l (if hardness 0-100)
0.45 ug/l (if hardness >100)
b) Copper-1 ug/l (if hardness 0-20)
5 ug/l (if hardness >20)
c) Lead-1 ug/l (if hardness 0-30)
3 ug/l (if hardness 30-80)
5 ug/l (if hardness >80)
d) Beryllium- 11 ug/l (if hardness <75)
1100 ug/l (if hardness >75)
(a) - Indicates units were /50ml rather than that shown.
- for pH of 6.5 to 9.0

LEGEND (MOE Obj.: Ontario Surface Water or Groundwater Objectives, revised July 1993)

J - The associated value is an estimated quantity.
U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.
-- - The parameter was not analyzed.
ND - The material was analyzed, but not detected above an unstated method detection limit.
TR - Trace level detection.
< - Indicates result less than that shown.
> - Indicates result greater than that shown.
R - The data was not useable.
NS - Insufficient sample.
p - Proposed MOE Surface Water Objective.
* - for PH >6.5 to 9.0
*** - a) Cadmium-0.15 ug/l (if hardness 0-100) b) Copper-1 ug/l (if hardness 0-20)
0.45 ug/l (if hardness >100) 5 ug/l (if hardness >20)
c) Lead-1 ug/l (if hardness 0-30) d) Beryllium- 11 ug/l (if hardness <75)
3 ug/l (if hardness 30-80) 1100 ug/l (if hardness >75)
5 ug/l (if hardness >80)
(a) - Indicates units were /50ml rather than that shown.
- for pH of 6.5 to 9.0

LEGEND

J - The associated value is an estimated quantity.
U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.
-- - The parameter was not analyzed.
ND - The material was analyzed, but not detected above an unstated method detection limit.
TR - Trace level detection.
< - Indicates result less than that shown.
> - Indicates result greater than that shown.
R - The data was not useable.
NS - Insufficient sample.
(a) - Indicates units were /50ml rather than that shown.

LEGEND

J - The associated value is an estimated quantity.

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.

UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.

-- - The parameter was not analyzed.

ND - The material was analyzed, but not detected above an unstated method detection limit.

TR - Trace level detection.

< - Indicates result less than that shown.

> - Indicates result greater than that shown.

R - The data was not useable.

NS - Insufficient sample.

(a) - Indicates units were /50ml rather than that shown.

LEGEND

J - The associated value is an estimated quantity.

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.

UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.

-- - The parameter was not analyzed.

ND - The material was analyzed, but not detected above an unstated method detection limit.

TR - Trace level detection.

< - Indicates result less than that shown.

> - Indicates result greater than that shown.

R - The data was not useable.

NS - Insufficient sample.

(a) - Indicates units were /50ml rather than that shown.

LEGEND

J - The associated value is an estimated quantity.

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.

UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.

-- - The parameter was not analyzed.

ND - The material was analyzed, but not detected above an unstated method detection limit.

TR - Trace level detection.

< - Indicates result less than that shown.

> - Indicates result greater than that shown.

R - The data was not useable.

NS - Insufficient sample.

(a) - Indicates units were /50ml rather than that shown.

LEGEND

J - The associated value is an estimated quantity.

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.

UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.

-- - The parameter was not analyzed.

ND - The material was analyzed, but not detected above an unstated method detection limit.

TR - Trace level detection.

< - Indicates result less than that shown.

> - Indicates result greater than that shown.

R - The data was not useable.

NS - Insufficient sample.

(a) - Indicates units were /50ml rather than that shown.

APPENDIX F

ANALYTICAL ASSESSMENT AND VALIDATION REPORTS

M E M O

TO: Peter Hayes REFERENCE NO: 1354-00

FROM: Lou Almeida/dm/1 DATE: April 26, 1993

RE: Bayview Landfill
Data Review for Samples Collected March 25, 1993

1.0 OVERVIEW

The following memo details an assessment of analytical results obtained from Barringer Laboratories (Barringer) (Report #934899) for samples collected March 25, 1993 at the Bayview Landfill Site (Site). Water samples were submitted to Barringer for the analysis of VOCs, alkalinity, chloride and sulphate.

The following summarizes the number of samples analyzed.

Investigative Samples	*Lab Blanks*	*Laboratory Duplicate*	*Total*
6	1	1	8

2.0 LABORATORY QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

2.1 SAMPLE HOLDING TIMES[1]

By comparing the sampling date of all samples with the reported date of extraction or analysis, the holding time is determined. The maximum holding time is not to be exceeded, as this is the maximum time allowed for the sample to be held before initiation of sample analyses. Otherwise, the sample results are considered to be suspect. Analytical methods and applicable holding times can be found summarized in Table 1.

Based on Barringer's reported analysis dates, all analyses were completed prior to the expiration of their prescribed holding times.

---

[1] Holding Time: The maximum time, beginning with sample collection, which can be allowed to elapse before extracting or analyzing a sample.

2.2 LABORATORY BLANKS

The assessment of laboratory blank analyses is to determine the existence and magnitude of contamination problems occuring in the laboratory. According to USEPA's "National Functional Guidelines for Organic Data Review", Revised June 1991, and, "Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis", Revised October 1989, no positive sample results should be reported unless the concentration of the compound in the sample exceeds five times (or ten times for methylene chloride, toluene and acetone) the amount found in the blank.

None of the target parameters were detected in the laboratory blanks; therefore, no qualifications were necessary.

2.3 SPIKE CHECK SAMPLE RESULTS

To ensure the capability of producing acceptable quantitative data by laboratory instruments, a spike check sample was analyzed in conjunction with organic and inorganic analyses.

Accuracy of the instrumentation and method was determined by comparing recoveries with generally accepted control limits. All the sample recoveries fell within generally accepted control limits, indicating acceptable instrument and method accuracy. Therefore, no qualifications were necessary.

2.4 SURROGATE RECOVERY

Laboratory performance on individual samples analyzed for VOCs is established by spiking activities. VOC samples were spiked with fluorobenzene and 4-bromofluorobenzene.

All surrogate recoveries were within acceptable limits, indicating acceptable laboratory performance. Therefore, no qualifications were necessary.

3.0 SUMMARY

In conclusion, it is recommended that the data produced by Barringer be accepted with no qualifications.

MEMO

TO: Peter Hayes REFERENCE NO: 1354-00/30

FROM: Lou Almeida/dm/2 DATE: May 21, 1993

RE: Bayview Landfill
Data Review for Samples Collected April 6, 1993

1.0 OVERVIEW

The following memo details an assessment of analytical results obtained from Mann Testing Laboratories (Mann), (Reports #9302693 and #9302694) and Conestoga-Rovers & Associates Analytical Services (CAS), (Report #470) for samples collected April 6, 1993 at the Bayview Landfill Site (Site). Water samples were submitted to Mann for the analysis of VOCs organo-chlorine pesticides/PCBs, metals[1] and phthalates and samples were also submitted to CAS for the analysis of alkalinity, biochemical oxygen demand (BOD), chemical oxygen demand (COD), chloride, fluoride, hardness, ammonia nitrogen, total kjeldahl nitrogen (TKN), phenols, total phosphorus, sulphate and total suspended solids (TSS).

The following summarizes the number of samples analyzed.

Laboratory	*Investigative Samples*	*Lab Blanks*	*Trip Blanks*	*Field Blanks*	*Field Duplicate*	*Total*
Mann	24	1	2	1	1	29
CAS	21	1	0	2	2	26

2.0 LABORATORY QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

2.1 SAMPLE HOLDING TIMES[2]

By comparing the sampling date of all samples with the reported date of extraction or analysis, the holding time is determined. The maximum holding time is not to be exceeded, as this is the maximum time allowed for the sample to be held before initiation of sample analyses. Otherwise, the

[1] Metals: Al, Ag, As, Ba, Be, Bl, Bo, Ca, Cd, Co, Cr, Cu, CN^-, Fe, Hg, K, Li, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Se, Sl, Sn, Sr, Tl, V, W, Zn.

[2] Holding Time: The maximum time, beginning with sample collection, which can be allowed to elapse before extracting or analyzing a sample.

sample results are considered to be suspect. Analytical methods and applicable holding times can be found summarized in Table 1.

Based on Mann's and CAS's reported analysis dates, all analyses were completed prior to the expiration of their prescribed holding times.

2.2 LABORATORY BLANKS

The assessment of laboratory blank analyses is to determine the existence and magnitude of contamination problems occurring in the laboratory. According to USEPA's , "Laboratory Data Validation Functional Guidelines for Evaluating Inorganic or Organic Analyses", Revised 1988, no positive sample results should be reported unless the concentration of the compound in the sample exceeds five times (or ten times for methylene chloride, toluene and acetone) the amount found in the blank.

No target parameters were detected in the laboratory blanks with the exception of bis-2-ethyl hexyl phthalate which was detected at trace levels. The resulting qualifications can be found in Table 2.

2.3 SPIKE CHECK SAMPLE RESULTS

To ensure the capability of producing acceptable quantitative data by laboratory instruments, a spike check sample was analyzed in conjunction with the samples analyzed for phthalate, metals, organo-chlorine pesticides and PCBs analyses by Mann. Spike check samples were not analyzed by CAS.

Accuracy of the instrumentation and method was determined by comparing recoveries with generally laboratory established limits. The sample recovery fell within control limits, indicating acceptable instrument and method accuracy. Therefore, no qualifications were necessary.

2.4 SURROGATE RECOVERY

Laboratory performance on individual samples analyzed for VOC's and phthalates are established by spiking activities. VOC samples were spiked with 1,2-dichloroethane-d_4, toluene-d_8 and 4-bromofluorobenzene. The sample analyzed for phthalates was spiked with di-n-octylphthalate-d_4. The sample analyzed for organo-chlorine pesticides and PCBs was spiked with 2,4,5,6-Tetrachloro-m-xylene.

Limits for di-n-octylphthalate-d_4 and 2,4,5,6-tetrachloro-m-xylene were not established, for those recoveries a generally accepted limit was used in the assessment of the data.

All surrogate recoveries were within laboratory established limits (see Table 3), indicating acceptable laboratory performance. Therefore, no qualifications were necessary.

3.0 FIELD QA/QC

3.1 FIELD BLANKS

Field blank results are reviewed in order to determine the existence and magnitude of contamination as a result of field conditions.

Upon review, all field blanks analyzed by Mann and CAS were free of target analytes with the exception chloride result (0.48 mg/L) as reported by CAS. As chloride was detected in the investigative samples at a level five times greater than the field blank result, data qualifications were not necessary.

3.2 FIELD DUPLICATES

As a check on the combined laboratory and field sampling precision duplicate samples were taken from PW1 and HC7-1 locations. The duplicate sample results were compared and relative percent difference[1] (RPD) calculated.

All duplicate RPD results for samples analyzed by CAS and Mann were well within acceptable limits; consequently no data qualifications were required.

3.3 TRIP BLANKS

Trip blank results were reviewed in order to determine the existence and magnitude of contamination attributable to sample transport, the environment and/or shipping.

---

[1] Relative percent difference = RPD = $\frac{|X_1 - X_2|}{\bar{X}} \times 100$

where:

X_1 - initial sample result
X_2 - duplicate sample result
$\bar{X}$ - mean of duplicate sample results

Upon review, the trip blanks were found to be free of target analytes; consequently, no data qualifications were necessary.

4.0 SUMMARY

In conclusion, it is recommended that the data produced by Mann and CAS be accepted for use noting the data qualification as presented in Table #2, resulting from the laboratory contamination arising from phthalate analysis.

MEMO

TO: Peter Hayes

REFERENCE NO: 1354-30

FROM: Lou Almeida/dm/3

DATE: August 10, 1993

RE: Bayview Landfill
Data Review for Samples Collected June 30 and July 1, 1993

1.0 OVERVIEW

The following memo details an assessment of analytical results obtained from Mann Testing Laboratories (Mann), (Reports #932473 and #9303410) and Conestoga-Rovers & Associates Analytical Services (CAS), (Report #539) for water samples collected June 30 and July 1, 1993 at the Bayview Landfill Site (Site). Water samples were submitted to Mann for the analysis of volatile organic compounds (VOCs), total coliforms, fecal coliforms and fecal streptococcus. Samples were also submitted to CAS for the analysis of alkalinity, chloride, ammonia nitrogen, total Kjeldahl nitrogen (TKN), phenols and sulphate.

The following summarizes the number of samples analyzed.

Laboratory	*Investigative Samples*	*Lab Blanks*	*Field Blanks*	*Field Duplicates*	*Total*
Mann	12	1	1	2	16
CAS	16	1	1	2	20

2.0 LABORATORY QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

2.1 SAMPLE HOLDING TIME CRITERIA[1]

By comparing the sampling date of all samples with the reported date of extraction or analysis, the holding time is determined. The maximum holding time criterion is not to be exceeded, as this is the maximum time allowed for the sample to be held before initiation of sample analyses. Otherwise, the sample results are considered to be suspect. Analytical methods and applicable holding time criteria can be found summarized in Table 1.

---

[1] Holding Time Criteria: The maximum time, beginning with sample collection, which can be allowed to elapse before extracting or analyzing a sample.

Based on Mann's and CAS's reported analysis dates, all analyses were completed prior to the expiration of holding time criteria.

2.2 LABORATORY BLANKS

The assessment of laboratory blank analyses is conducted to determine the existence and magnitude of contamination problems occurring in the laboratory. According to USEPA's , "Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses", Revised July 1988 and "Laboratory Data Validation Functional Guidelines for Evaluating Organic Analyses", Revised February 1988, no positive sample results should be reported unless the concentration of the compound in the sample exceeds five times (or ten times for methylene chloride, toluene, 2-butanone and acetone) the amount found in the blank.

No target parameters were detected in the laboratory blanks with the no exceptions. Data qualifications were not required.

2.3 SURROGATE RECOVERY

Laboratory performance on individual samples analyzed for VOCs are established by spiking activities. VOC samples were spiked with 1,2-dichloroethane-d_4, toluene-d_8 and 4-bromofluorobenzene.

All surrogate recoveries were within laboratory-established limits (see Table 2), indicating acceptable laboratory performance. Therefore, no qualifications were necessary.

3.0 FIELD QA/QC

3.1 FIELD BLANKS

Field blank results are reviewed in order to determine the existence and magnitude of contamination as a result of field conditions.

Upon review, the field blank analyzed by Mann and CAS was found to be free of target analytes. Consequently, data qualifications were not necessary.

3.2 FIELD DUPLICATES

As a check on the combined laboratory and field precision, duplicate samples were taken from PW1, HC4-3 and SW10-87 locations. The duplicate sample results were compared and relative percent difference[1] (RPD) calculated.

All duplicate RPD results for samples analyzed by CAS and Mann were well within acceptable limits; consequently, no data qualifications were required.

4.0 SUMMARY

In conclusion, it is recommended that the data produced by Mann and CAS be accepted without data qualification.

---

[1] Relative percent difference = RPD = $\frac{|X_1 - X_2|}{\bar{X}} \times 100$

where:

X_1 - initial sample result
X_2 - duplicate sample result
$\bar{X}$ - mean of duplicate sample results

TO: Greg Ferraro / Peter Hayes REFERENCE NO.: 1354-30

FROM: Rob Toth DATE: January 25, 1994

CC: Lou Almeida

RE: Bayview Park Landfill Site
Data Review for Samples Collected October 19, 1993

1.0 OVERVIEW

The following memo details an assessment and validation of analytical results obtained from Mann Testing Laboratories (Mann) (Mann report #'s 934058 and 9305511) and CRA Analytical Services (CAS) (CAS report # 657) for 1 water sample collected October 19, 1993. Samples were submitted to Mann for the analyses of metals[1] , total cyanide, bis(2-ethylhexyl)phthalate (BNAEs), pesticides[2] , total polychlorinated biphenyls (PCBs) and volatile organic compounds[3] (VOCs). Samples were submitted to CAS for the analysis of general chemistry (alkalinity, biochemical oxygen demand (BOD), chloride, chemical oxygen demand (COD), fluoride, hardness, ammonia, total kelhdjal nitrogen (TKN), total phenols, total suspended solids (TSS) and sulphate).

Parameter	*Investigative Samples*	*Lab Blanks*	*Lab Duplicates*	*Field Blanks*	*Field Duplicates*	*Total*
Metals	1	1	0	1	0	4
Total cyanide	1	1	0	1	0	4
BNAEs	1	1	0	1	0	4
Pesticides	1	1	0	1	0	4
PCBs	1	1	0	1	0	4
VOCS	1	1	0	1	0	4
General Chemistry	1	1	0	1	0	4

---

[1] metals = aluminum, antimony, arsenic, barium, bismuth, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, tin, titanium, vanadium, zinc

[2] pesticides = aldrin, carbaryl, chlordane, DDT, Diazinon, dieldrin, endrin, heptachlor, heptachlor epoxide, lindane, methoxychlor, methyl parathion, parathion, toxaphene

[3] VOCs = 1,1-dichloroethane, 1,2-dichloroethane, 1,1,1-trichloroethane, benzene, trichloroethylene, toluene, tetrachloroethylene, ethylbenzene, chlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, m+p-xylene, o-xylene

2.0 SAMPLE HOLDING TIMES [1]

By comparing the sampling date of all samples with the reported date of extraction or analysis, the holding time is determined. The maximum holding time is not to be exceeded as this is the maximum time allowed for the sample to be held before initiation of sample analyses; otherwise, the sample results are no longer considered accurate.

Mann and CAS reported all analyses dates and all analyses were completed prior to the expiration of prescribed holding times; therefore, no qualifications were necessary.

3.0 LABORATORY QA/QC

3.1 Laboratory Blanks

The assessment of laboratory blank analyses is conducted to determine the existence and magnitude of contamination problems occurring in the laboratory. According to USEPA's , "Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses", Revised July 1988 and "National Functional Guidelines for Evaluating Organic Analyses", Revised June 1991, no positive sample results should be reported unless the concentration of the compound in the sample exceeds five times (or ten times for metals, methylene chloride, 2-butanone (MEK) and acetone) the amount found in the blank.

Iron and zinc were found in the Mann laboratory blank and alkalinity was found in the CAS laboratory blank at values of 0.006 mg/L, 0.006 mg/L and 1.3 mg/L respectively. All sample concentrations for alkalinity were above five times the amount found in the blank; therefore, qualifications were not necessary for alkalinity.

Positive detections of iron and zinc were found in concentrations below ten times the amount found in the blank; therefore, qualifications were necessary and can be found summarized in Table 1.

3.2 Surrogate Recovery

Laboratory performance on individual samples is established by spiking activities. VOC samples were spiked with d_8-toluene, d_4-1,2-dichloroethane and 4-bromofluorobenzene. Pesticide and PCB samples were spiked with 2,4-dichlorophenyl acetic acid and 2,4,5,6-tetrachloro-m-xylene. BNAE samples were spiked with 2-fluorobiphenyl and D_{14}-terphenyl.

All of the samples showed recoveries within the laboratory control limits, therefore no qualifications were necessary.

---

[1] Holding Time: The maximum time, beginning with sample collection, which can be allowed to elapse before extracting or analyzing a sample.

3.3 Method Spike

A method spike sample is an aliquot of reagent-free water which has been spiked with the compounds of interest and is analyzed to ensure that the methodology and instrumentation are in control. Method spike samples were analyzed by Mann for metals (except tin), pesticides, PCBs and BNAEs.

Method spike recovery percentages were found to be within acceptable control limits; therefore, no qualifications were necessary.

4.0 FIELD QA/QC

4.1 Field Blanks

The assessment of field blank analyses is conducted to determine the existence and magnitude of contamination problems occurring in the field. According to USEPA's , "Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses", Revised July 1988 and "National Functional Guidelines for Evaluating Organic Analyses", Revised June 1991, no positive sample results should be reported unless the concentration of the compound in the sample exceeds five times (or ten times for metals methylene chloride, 2-butanone (MEK) and acetone) the amount found in the blank.

Aluminum, iron, vanadium and zinc were found in the field blanks at values of 0.054 mg/L, 0.008 mg/L, 0.004 mg/L and 0.004 mg/L respectively. Sample concentrations for iron and zinc were above ten times the amount found in the blank. A summary of the qualifications for aluminum and vanadium can be found in Table 1.

4.2 Travel Blanks

As a check on sample contamination originating from sample transport, shipping and from site conditions one travel blank was submitted to Mann for the analysis of VOCs.

All VOC parameters in the travel blank were non-detect; therefore, qualifications were not necessary.

5.0 SUMMARY

Qualifications were necessary for iron and zinc based on positive detections found in the lab blank and qualifications for aluminum and vanadium were necessary based on positive detections found in the field blank. These qualifications are summarized in Table 1.

The data supplied by Mann and CAS were found to exhibit acceptable levels of accuracy and precision and may be used with the qualifications noted herein.

TABLE 1
SUMMARY OF QUALIFICATIONS
Project 1354-30 - Bayview Park

Lab	*Lab Sample #*	*Location*	*Parameter*	*Result (mg/L)*	*Qualifier*	*Reference*

[1] U = The material was analyzed for but was not detected above the sample quantitation limit.

APPENDIX G

EXCERPTS FROM REASONS FOR DECISION AND DECISION DATED FEBRUARY 24, 1989 (PAGES 83 TO 107) - REGIONAL MUNICIPALITY OF HALTON HEARING

Ontario

The Joint Board

THE CONSOLIDATED HEARINGS ACT, 1981

REASONS FOR DECISION

and

DECISION

IN THE MATTER OF an application by the Regional Municipality of Halton for:

a) the acquisition of land for the construction, operation and maintenance of a sanitary landfill site to contain 7.96 million cubic metres of waste in the Regional Municipality of Halton by one of two alternative methods as follows:

(i) landfilling at the site referred to in Halton's Environmental Assessment as Site F in the City of Burlington;

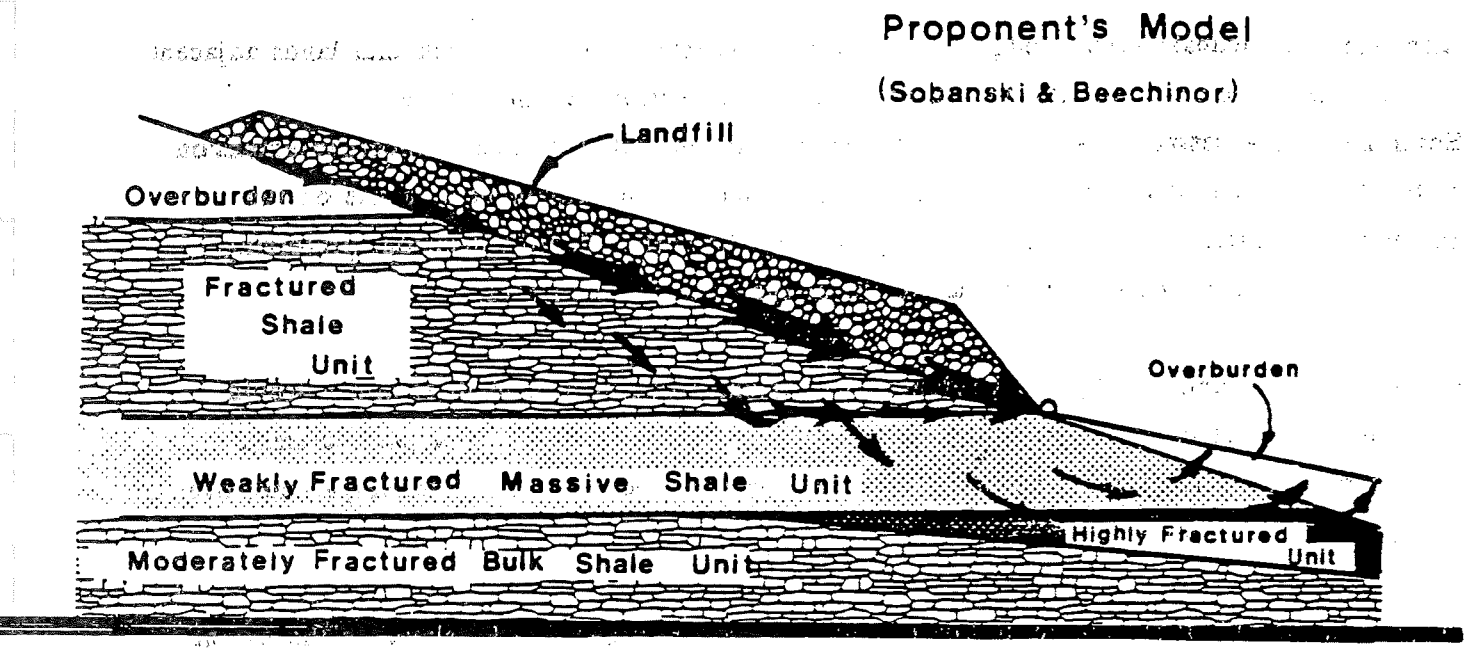
(ii) landfilling at the site commonly referred to in Halton's Environmental Assessment as Site D in the Town of Milton.

Before: H.H. Lancaster, Q.C.
D.J. Kingham, Ph.D.

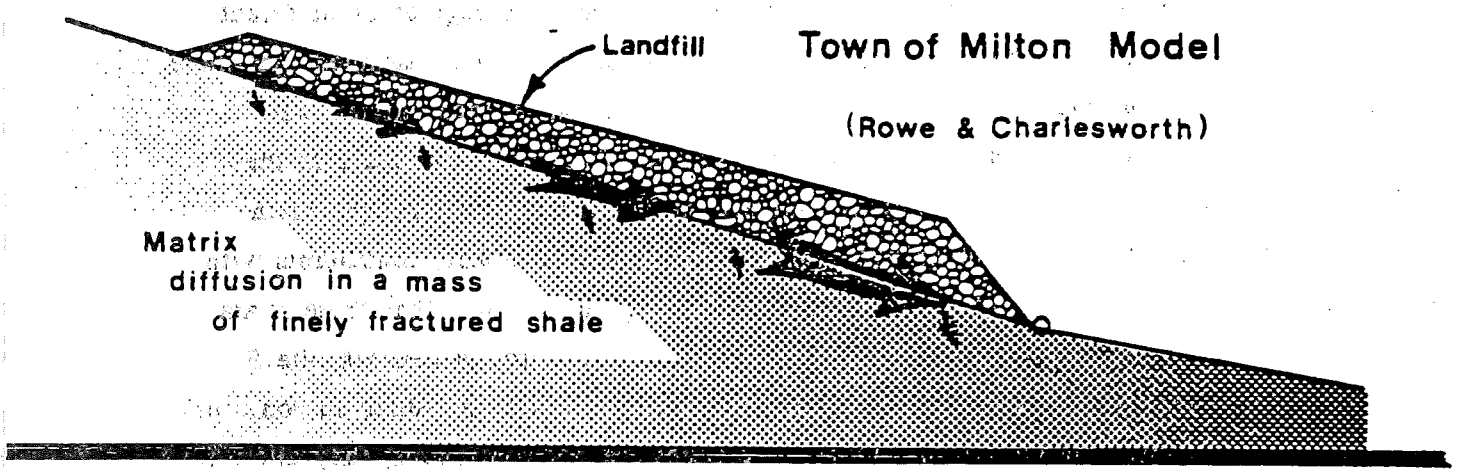
February 24, 1989

2300 Yonge Street
Suite 1201
Toronto, Ontario M4P 1E4
Tel: (416) 323-4806

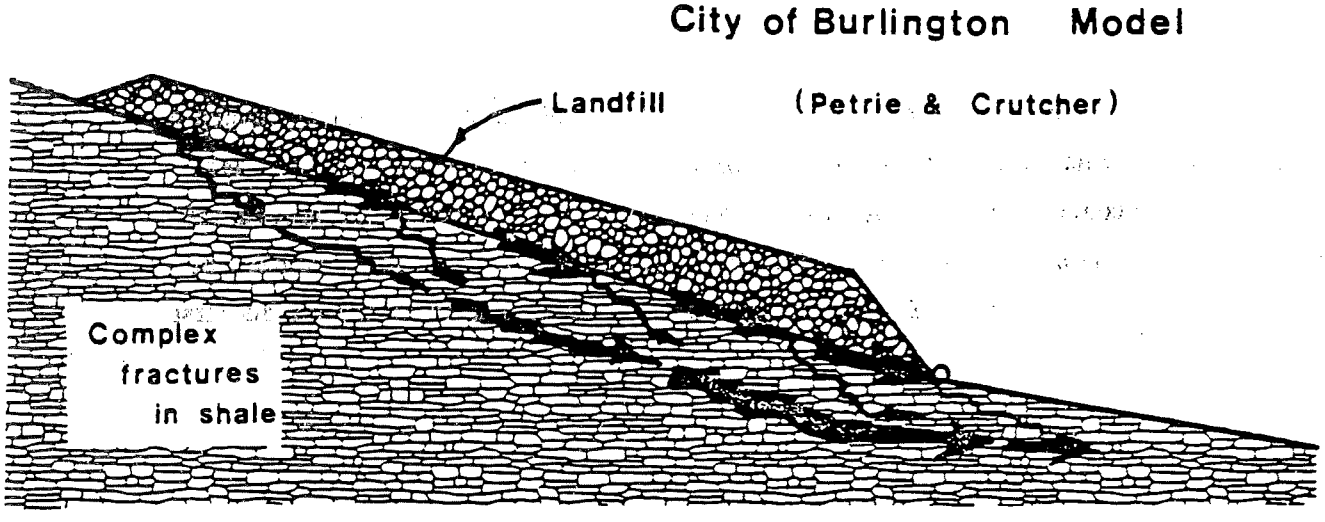
Site F



Although Mr. Sobanski acknowledged during cross-examination by Ms. Cronk that lands adjacent to Site F had been used for landfills, in keeping with an earlier decision of the Environmental Assessment Board, this Board notes that the earlier decision concerned extension of the site into the glacial till areas to the north, rather than development of a site on the gullies to the south. This Board was not swayed by the earlier Board's decision, preferring to judge the present application on the weight of the evidence before us.



Furthermore, as explained by Mr. Crutcher, the current proposal to landfill at Site F would add waste at a rate of approximately 76,000 tonnes/hectare over a large area (50 hectares), when compared to adjacent dumpsites which together averaged only 50,000 tonnes/hectare over a smaller area (44 hectares).



In general, the different opinion of hydrogeologists who examined Site F related to the extent of uniformity within strata beneath the site. All agreed that there are regions of different porosities and conductivities. The hydrogeology consultants for the Region assumed that there were several discreet continuous layers acting as surficial drains, subsurface barriers and subsurface underdrains as one goes down through the strata. Dr. Rowe assumed that these strata could be modelled as a uniform, thick, relatively impermeable layer through which leachate would not move. On the other hand, Messrs. Petrie and Crutcher, consultants with Conestoga Rovers Associates, on behalf of the City of Burlington, assumed that these strata, if they exist at all, are not continuous. Rather, in their view, the ground beneath Site F constitutes a heterogeneous mixture, with zones of impermeable matter embedded in zones of less impermeable matter. Because these impermeable zones are not continuous, they allow for the infiltration of leachate along discreet, but as yet unmeasured, significant vertically fractured areas.

If the latter model is correct, it seems to the Board that the problem of delineating leachate flow paths at site F would be like trying to determine blood circulation patterns in a new species by inserting needles in various parts of its anatomy. If the investigator missed the main veins or arteries with the first few needles, he might conclude that the movement of blood within was very low. How different his opinion had he struck an artery on his first attempt.

Figure 3 Site F Models

As perceived by Messrs. Petrie and Crutcher the Board had three hypotheses to consider at Site F. The original proposal by the Region portrayed the underlying strata as three or more distinct layers with specific abilities to retard or enhance the movement of groundwater. The hypothesis put forward by consultants for the Town of Milton was to consider the entire area beneath Site F as a homogeneous and relatively impermeable stratum, such that leachate would not escape the site, for modelling purposes. The Burlington consultants' model was one of complex groundwater flow through fractured rock which could not be readily understood, monitored or modeled.

It was clear to the Board from Ms. Cronk's cross-examination of Mr. Sobanski that Site F was one of the most studied sites in Ontario, from a hydrogeological perspective. But the earlier NSP conclusions, and those of TROW, were founded on the premise that the hydrostratigraphy was relatively uniform across the site.

Trow Hydrology Consultants Limited (THCL) consultants took this assumption one step further: the uniform hydrostratigraphy extended across the site in both east-west and north-south directions like a layered cake. The ground surface could be taken as the exposed side of a gently inclined diagonal cut, from top to bottom. The assertions of safety at Site F had all been based in some measure on the validity of this model, in particular the postulated "Weakly Fractured Massive Shale Unit":

> "The dominant hydrostratigraphic unit controlling leachate migration at Site F is the Weakly Fractured Massive Shale Unit. Tests show that this unit has relatively good attributes for waste disposal. It has good attenuation capability and a low hydraulic conductivity (no more than 1 x 10^{-7}cm/s). Farther along the flow system, the Discharge Zone Till provides additional capability for the natural attenuation of leachate."
>
> H-40 pp xii & xiii

During his re-examination, Mr. Feenstra had redrawn subterranean chloride concentrations in an east-west orientation to illustrate hydrogeologic strata on new cross-sections at Site F. A review of these cross-sections, shown as Attachment 3 to H-936, and the revised chloride data plotted on exhibit H-659R, reveal examples of relatively fresh water both above and below the

postulated weakly fractured massive shale (at wells HC-5 and MB-11 for example), when the hypothesis calls for the water above to be relatively fresh, and that below relatively salty, at all locations on the site. On the other hand, at different locations (wells WAT-7 and HC-8 for example), it appears that there is no fresh water to speak of, even at the surface.

The revised exhibit H-659R also shows significant variations in the postulated 'highly fractured shale' unit where hydraulic connection is supposed to be good and chemical concentrations similar. Adjacent chemical measurements (in a cross-sectional sense) show concentrations of 1,140, 21,100, 3,410, and 810 milligrams of chloride per litre of groundwater. This evidence, and the variations across the 'weakly fractured massive shale' unit, place the original THCL hypothesis about Site F in considerable doubt.

Nothwithstanding his denial of Trow's original assumptions about the hydrostratigraphy at Site F, Mr. Feenstra was of the opinion that toe drains and perimeter drains would prevent surface water contamination at the site.

Mr Feenstra's final opinion about the hydrostratigraphy was that there is a shallow active zone of varying thickness, generally between five and ten meters thick. This zone is thinner in areas of high chloride and low tritium (such as around well HC-8), and thicker in areas of low chloride and high tritium (such as in areas around well HC-4). In his view, the net effect would be exfiltration (liquid flowing out of a porous medium) at the bottom of the landfill of about ten to twenty millimeters per year, of which 90% or so would exit laterally through the shallow active zone, and the rest would move to depth. If these figures are correct, they correspond to leachate losses from about 3,017 gallons/day to about 6,035 gallons/day in total, with 302 to 604 gallons/day moving to depth. The witness did not feel that a liner was required to reduce exfiltration.

Because the proponent's consultants recognized that the shales underlying Site F have a complex fracture system both near the surface and at depth, they did some pumping tests which showed a substantial water flow, and led to the conclusion that the hydraulic conductivity in the highly fractured zone was 1.3×10^{-2} cm/sec (for comparison purposes 1.3×10^{-2} cm/sec is about 2.5 miles per year). This groundwater flow is towards Hamilton Harbour and is driven by water pressure, the force of which is reflected by hydraulic gradients ranging from 0.001 to 0.03. Groundwater contours (Drawing 14 of exhibit H-40) fall by about 70 meters across the site, illustrating the large magnitude of the force drawing water away from the site.

The review by the Region's consultants (Messrs. Beechinor and Sobanski) of borehole logs in the vicinity of Bayview Park to the east of Site F, revealed that for most of the holes dug there was clay overlying the rock beneath, and that the clay layers were approximately 8 feet thick at well locations LW-1 through LW-6. If such silty clay overlays the rock under the Bayview landfill, then the Board must take this into account in considering the migration of leachate beyond the site boundaries, and the postulated 'security' of Site F, based on the performance of adjacent sites. Similarly, a large portion of the Burlington Landfill site was acknowledged to be on till, whereas some 60-70% of Site F would be founded on shale.

Drawing 12 of exhibit H-40 shows a till thickness of 8 metres at borehole HC-5, towards the southern edge of the site. Mr. Feenstra's evidence is that the zone of active groundwater flow at this point is 11 m thick below the bedrock surface. Based on his evidence the Board visualized the active flow zone at Site F, in plan view, as rivulets which divide and recombine below the surface, leading to contaminant losses off site. A perimeter drain might have to be as deep as 19 meters (about 62 feet) in the vicinity of HC-5 (near the southern boundary of the site) in order to intercept such leachate egress. Even this containment measure requires a better knowledge of subsurface flow patterns than exists now. The situation has not changed much since November 15, 1982 when a hydrogeologist, Keros Cartwright wrote, in support of a proposal by National Sewer Pipe Limited to landfill on part of Site F:

> "The intermediate groundwater flow interacts to some degree with the regional and local groundwater flow systems; the degree of this interaction is not well defined by the data. The local and intermediate groundwater flow needs to be considered in evaluating leachate migration at the proposed site.
>
> N-470 p 2

Dr. Rowe, the modeling expert called by the Town of Milton, felt that a liner is not required at Site F because the groundwater migration in the vicinity of that site is very sluggish and there would be no threat to down-gradient users.

Dr. Charlesworth felt that a new landfill at Site F would have little impact on the environment because the groundwater quality under the site is quite saline already. It was his view that perhaps the best use for this already 'contaminated' environment would be as a

receptacle for contaminants from landfill leachates, notwithstanding the fact that chemical constituents presently in the groundwater at depth are of natural origin.

Mr. Petrie explained that when he examined the hydrostratigraphy in the vicinity of Site F he came to a much different conclusion than had THCL consultants. His examination of the borehole logs did not lead him to conclude that there were identifiable, distinct geological zones beneath Site F. He noted that even the proponent's hydrogeologists had proposed geologic and hydrostratigraphic zones which do not correspond to one another. In particular, he drew the Board's attention to the fact that the supposed hydraulically conductive zone of "highly fractured shale" is found in large part at an elevation at which one is supposed to find the "weakly fractured massive shale", which was to have opposite hydraulic characteristics.

Furthermore, Mr. Petrie pointed out that piezometric measurements in the area lead to equipotential contours which are at variance with the assumed geology and hydrostratigraphy. In particular, he believed that such contours refute the existence of the proposed highly fractured "geological underdrain". Mr. Petrie noted that hydraulic gradients in the postulated discharge zone are downwards, rather than upwards as predicted by the Trow model. Similarly, hydraulic conductivities at well holes HC4, HC6, HC8 and HC14 do not support the proponent's model with respect to the weakly fractured or highly fractured shale layers.

Mr. Sobanski could not explain the considerable variation in chemical contaminants in the upper till at the north end of Site F. This raised questions about the validity of the assumed homogeneous strata model in that area. One explanation could be a variation in topography, but a more likely explanation is a variation in the conductivity and porosity of underlying materials. The controlling factor was not identified to the Board's satisfaction.

During cross-examination of Messrs. Sobanski and Beechinor, Mr. Tidball, counsel for the Ministry of Environment, brought to the Board's attention the fact that the consultants had described the presence of fractures in one 10 cm (4 inch) core section, their absence in the adjacent 10 cm zone and their presence again in the next 10 cm zone. Why then was the entire area not considered fractured, if there are significant fractures in alternate 4 inch sections?

The introduction of exhibit H-220 was a signal event in the cross-examination of witnesses Sobanski and Beechinor. Figures 2 and 4 of Exhibit H-40 had presented a facile

But the hydrogeology experts called by the Town of Milton, Drs. Charlesworth and Rowe, did not support Mr. Sobanski's postulated highly fractured underdrain and its associated stratigraphy:

> "Trow's hydrostratigraphic definition of various units within the shale is somewhat tenuous, as are the results of the computer modelling which was based on their conceptual model of the hydrostratigraphy. ... Leachate contaminated water which moves to depth in the shale will flow laterally, in a sluggish flow system, towards Hamilton Harbour..."
> M-437 p 7-1

This has significant implications: it removes the leachate pathway postulated by Trow Hydrology Consultants Limited, and it also removes the proposed contingency measure of developing purge wells down-gradient in order to intercept escaped leachate. In the context of the Charlesworth and Rowe evidence, it can be argued that the absence of the highly fractured zone supports their hypothesis that diffusion of contaminants through the strata beneath Site F would be slow. The Board could not conclusively determine what the real situation might be beneath Site F, since these experts contest the interpretation of the proponent's experts, and there was no absolute determinant to verify either their model or the proponent's.

In support of his model of complex vertical and horizontal fracturing in the surficial layer, Mr. Petrie drew the attention of the Board to the highly variable tritium data, which at well HC-5 shows the presence of pre-1952 water at great depth, whereas a nearby well, HC-8, shows the absence of such water. This contrast illustrates a lack of substantial hydraulic connection between these two wells within THCL's postulated continuous geologic underdrain at Site F.

Mr. Petrie added that in his opinion the pumping tests in the vicinity of Site F do not support the existence of a highly fractured zone underlying the site.

Of greatest concern to Mr. Petrie in regard to the pumping results was the fact that monitors at the bottom of well HC-3, below the postulated weakly fractured zone, responded to pumping at pumping well 3, above the weakly fractured zone. This led to the conclusion that there were vertical hydraulic connections through the supposed weakly fractured shale. The implications of this are that if water can be drawn upward through this presumed impermeable

layer to a pumping well above it, then leachate from waste can percolate down through this postulated zone and reach lower strata, from whence it could migrate off-site.

When Messrs. Petrie and Crutcher studied all of the slug tests and pressure packer tests they came to the conclusion that the conductivity of the postulated "weakly fractured shale" was higher than that calculated by the proponent's geologists. They assigned a value of about 2×10^{-4} cm/sec (about 7 inches per day) in this zone, which they feel constitutes an extensive weathered and fractured shale mantle.

Further supporting their concern about the integrity of the postulated "weakly fractured massive shale unit", is the fact that the second piezometer (hydraulic head measuring device) at well MB-11, which is supposed to lie entirely within the postulated zone, is a flowing well. This is inconsistent with the low hydraulic conductivity proposed for the area.

In contrast to the bulk matrix diffusion model proposed by Drs. Charlesworth and Rowe, Mr. Petrie offered the opinion that a significant volume of contaminants from Site F would move through a few discreet but serious rock fractures. Mr. Petrie concluded that "a porous medium model ... cannot adequately reproduce the complexity of the site nor provide the basis for contaminant transport modelling within the fractures".

The Petrie and Crutcher model, in contrast to that of Drs. Rowe and Charlesworth, is based on considerable inhomogeneity across the site, which results in areas or volumes of rock which are relatively impermeable, in comparison with other volumes through which leachate could percolate fairly readily.

The monitoring wells in the WAT series (University of Waterloo studies around Site F) show how small scale complexities in groundwater flow can be illustrated by means of closely spaced piezometers. Such complexities would be missed with the more traditional widely-spaced measurements. The WAT wells show that hydraulic gradients, and therefore groundwater flow directions and magnitudes, change significantly with location, time and depth.

Mr. Petrie concluded that organic nitrogen plume delineation experiments were inconclusive. The interconnected fractures beneath the site could include "fracture zones" up to 30 cm in thickness. In these fracture zones the groundwater velocities are unknown but in the witness'

Feenstra's own denial of the proponent's hydrostratigraphic model in his final appearance before the Board.

Mr Feenstra felt that the non-detection of volatile organics at the site boundary of the present Burlington landfill and the closed Bayview landfill were not indicative of anything, since according to the proponent's own model, leachates from these sites might not yet have migrated through the relatively impermeable layer.

While cross-examining Mr. Feenstra, Ms. Cronk, counsel for National Sewer Pipe Limited, drew the Board's attention to a comparison between Site F and the approved Domtar disposal site for fly ash in shale at Mississaugua. Although the disposal of fly ash had apparently been approved by another Environmental Assessment Board, we recognize the differences between the two situations, including the fact that the contaminants in fly ash are different from those in domestic wastes, and the fact that the leachate from the Domtar disposal site was non-potable and non-toxic primarily because of the presence of sulphates and chlorides. The differences were clear when the Board reviewed Table 1 of exhibit H-86A which shows thousands of micrograms per litre of volatile organics in Burlington landfill leachate.

Mr. Feenstra, in explaining the downward movement of chemical contaminants at site F stated quite unequivocally:

> "We have no way of directly measuring the vertical hydraulic conductivity which is the actual important parameter with respect to downward movement through that zone."
>
> 45 p 10,169

The zone in question was the postulated 'weakly fractured massive shale', and without a reasonably reliable value for "the actual important parameter" the Board would be hard pressed to approve landfilling at Site F if this meant that it would be unable to assure the public that there could not be significant migration of contaminants away from the proposed landfill site.

The significance of this uncertainty was compounded by the many exhibits which showed downward gradients, not upward gradients, in the area between Highway 403 and the CNR tracks south of the site. Upward gradients are shown in the residential areas to the southeast. This means

that if contaminants do migrate into a more conductive stratum beneath the landfill, they could emerge, not north of the residences, but in the vicinity of the residences.

Although tritium data from exhibit H-173 reminded the Board that Site D showed no penetration of tritium through the unweathered upper till, the tritium data at Site F reveal considerable migration to lower strata. Mr. Feenstra explained that vertical fracturing through the "weakly fractured shale" would account for the highly variable tritium result.

During Ms. Vigod's cross-examination, Mr. Feenstra stated that with a failed trap at Site D, contaminants would arrive at the site boundary in approximately 60 years, but they would arrive at the site bounary in only 30 years at Site F with the proposed containment measures in operation. Because Site D suggested no contaminant loss with containment systems in operation, Mr. Feenstra opined at the end of his first appearance before the Board that this should be the preferred site. After introducing the till-fracturing hypothesis in his last appearance, he changed his preference back to Site F.

In response to cross-examination from Mr. Tidball, Mr. Feenstra acknowledged that monitoring could be done at both sites, but at Site D it would be simpler, less expensive and more reliable than would be the case at Site F. The Board was not satisfied that a monitoring system at Site F could reliably intercept all contaminant migration pathways.

One of the significant aspects of Mr. Feenstra's evidence, in conjunction with that of Messrs. Beechinor and Sobanski, is that these witnesses do not consider the case of underdrain failure at Site F. The calculations for "constant contaminant input" are based on the underdrain system working. This represents another instance of the dissimilar evaluation of the two sites in favour of site F. These witnesses acknowledge that there will be contaminant losses to the wider environment. For a weakly absorbed compound there would be losses which would reach concentrations of about 180 micrograms per litre. For certain of these chemicals, included in the United States Environmental Protection Agency list of priority pollutants for which there are drinking water standards, concentrations are supposed to be well below 200 micrograms per litre.

Using the data available to them, the Region's consultants developed a computer simulation of groundwater flow that showed considerable flow into the ground in the vicinity of Site F and

vicinity of Site F, and therefore leachate from the landfill could appear in the springs south of the site.

Dr. Rowe used Dr. Charlesworth's hypothesis about subterranean strata in the vicinity of Site F to calculate the amount of leachate expected to escape from the area. Using theoretical considerations about matrix diffusion he calculated that some 0.3% of leachate would get into the rock beneath the site, rather than the 5% originally proposed by the proponent. His worst case scenario corresponded to 0.8% of leachate passing into the strata. The reason Dr. Rowe felt that the quantity of leachate entering the rock would be smaller, was because he concluded that a critical parameter, the Darcy velocity, should have been calculated as 0.05 meters per year rather than the 0.7 meters per year used by the Regional Municipality of Halton's expert witness. Taking account of the quantity of pollutants in the landfilled waste, the lower value for the Darcy velocity, and the effects of matrix diffusion, this witness concluded that there would be no discernible off-site migration of contaminants.

Drs. Rowe and Charlesworth stated that their "shallow zone" proposed for Site F was not meant to represent a recognizable geological feature of 25 metres thickness, but was rather a mathematical artifact defined by the boundary between water which was saline (containing more than 5,000 mg/litre of chloride) and water that was less saline.

Dr. Charlesworth observed that his model was not based upon actual or measured geology, gradients or conductivities, but may rather be a simplified conservative model leading to a worse conclusion than might be expected. Dr. Rowe added that the most difficult parameters to determine are aperature size and smoothness in fractured rock and hence the permeability of the rock. Their entire modelling exercise depended on assumptions about homogeneity, and a circumscribed range of values for the Darcy velocity, which may not be valid.

Dr. Rowe acknowledged that all of his scenarios were based on the assumption that it is resonable to homogenize variables, including contaminant concentrations, throughout a uniform thickness. Thus it was assumed that if contaminants do not exist at one location down-gradient of a landfill site they must not exist anywhere down-gradient; if measured conductivities at one point are one hundred or one thousand times as great as at another point, it is fair to assume that their average applies throughout.

Dr. Rowe explained that his mathematical model, which led to the Site F worst case scenario was based on the assumption that all leachate could exist in a layer 25 meters thick beneath the site, and move downgradient. If this were the case, then monitoring wells would detect it after a certain period of time. Since it had not been detected, he concluded that the groundwater velocity must be low and infiltration must be low. But some contaminants would move out at the surface (a great deal according to his colleague Dr. Charlesworth) and some would move to depth, so the amount remaining in the layer is not great. Therefore, detection may not be a valid indicator of contaminant velocity and the model may be inadequate.

Dr. Rowe acknowledged that his model does not accommodate "local variations" that exist in the vicinity of Site F because "everything is not that simple". The Board agrees.

In the context of the analogy to the mapping of circulation by the insertion of a few needles into the specimen being examined, the Board was interested to hear Dr. Charlesworth explain that the assumption of arrival times, based on monitoring at wells down-gradient from the Burlington landfill, could be wrong because the monitoring locations selected might have missed significant downward migration pathways. The Charlesworth/Rowe homogenized model would be jeopardized if the fracture model was correct and the monitoring points selected to indicate the arrival of the leading edge of contaminant plumes had missed fracture zones which carry the bulk of the contaminants.

Mr. Petrie felt that the monitoring well for calibration of Dr. Rowe's model may not be representative of water quality everywhere south of the site and, in fact, it may not correspond to the hydrogeology at Site F. It was not, in his view, a useful calibration point for Dr. Rowe's matrix diffusion model.

Drs. Rowe and Charlesworth stated that their choice of groundwater and contaminant migration velocity beneath Site F was based largely on the assumption that since they had not detected contaminants at a well 25 metres south of the Burlington landfill, after a certain number of years, the groundwater velocity must be very slow. It was acknowledged, however, that this assumption did not accommodate the possibility that the monitoring well down-gradient of the Burlington landfill might have missed contaminant migration from that landfill site.

Dr. Rowe observed that if contaminants are removed by pathways other than that into the 25 metre thick zone beneath the Burlington landfill then the concentration of contaminants at the

about 100 feet per year through a depth of about 100 feet for a total distance of about 2,000 feet southest of the landfill. At that time the Ministry of the Envronment did not recommend purge wells as an appropriate contigency measure at the Bayview Park site.

Messrs. Sobanski and Beechinor stated that even with the proposed tile drainage system it would not be possible to stop the downward migration of contaminants. Some leachate (estimated to be 5%) would get through the drainage tile field and into lower and surrounding strata. It was explained that it is not possible to build a "hydraulic trap" at this site because of the very high hydraulic gradients in the area. At page 132 of exhibit H-40 the consultants observe "that the natural rate of leakage from the site to the intermediate flow system is low, at about 10,000 cubic metres per year". This corresponds to about 2.2 million gallons per year - the Board questions the use of the term "low".

Mr Petrie disagreed with the proponent's consultants about the existence of both the weakly fractured massive shale unit and the highly fractured shale unit underlying Site F. Rather, he felt that the whole area beneath the site was sufficiently fractured to receive leachate from the landfill itself.

Messrs. Sobanski and Beechinor argued that their model was conservative because it showed leachate emerging from the ground between the dump site and Lake Ontario. The implication was that the spread of contaminants to the wider environment of the waters of lake Ontario was of less concern. The Board is not persuaded that such an interpretation is consistent with the purpose of the Environmental Assessment Act.

Mr. Petrie disagreed with Mr. Sobanski's view that the discharge zone existed between Highway 403 and the CNR tracks citing, among other things, exhibit B-621 which shows the water table well below ground surface at well HC-14, in the postulated discharge zone.

There is a dramatic deterioration of groundwater quality with depth in the shale, so much so that deeper waters do not meet drinking water criteria because of natural inorganic ions there present. For these reasons, a 1985 Gartner Lee report concluded that the leachate plume would not "cause significant off-site impact on groundwater". This quote relates to inorganic ion impact rather than organic and possibly toxic chemicals, since the 1986 Gartner Lee plume delineation study revealed that the existing Burlington landfill site has generated a plume which had migrated 45 metres south of the site.

When Dr. Charlesworth also referred to "poor quality groundwater" he qualified this by adding that its quality was poor because of natural compounds such as chlorides but not because of human activities.

The failure of leachate drains at Site F could lead to off-site migration either through the very shallow system or through deeper systems. Dr. Charlesworth excluded the possibility that there could be leachate loss through some intermediate system which would affect people downgradient. He acknowledged that there could be surface water impacts because of the very shallow flow system but he did not think the control of leachate at Site F is an essential aim because:

> "the most reasonable use of the groundwater regime downgradient at Site F and its environs is for waste disposal; the poor quality groundwater of this area is a good resource for the disposal of waste"
>
> M-444 p 39

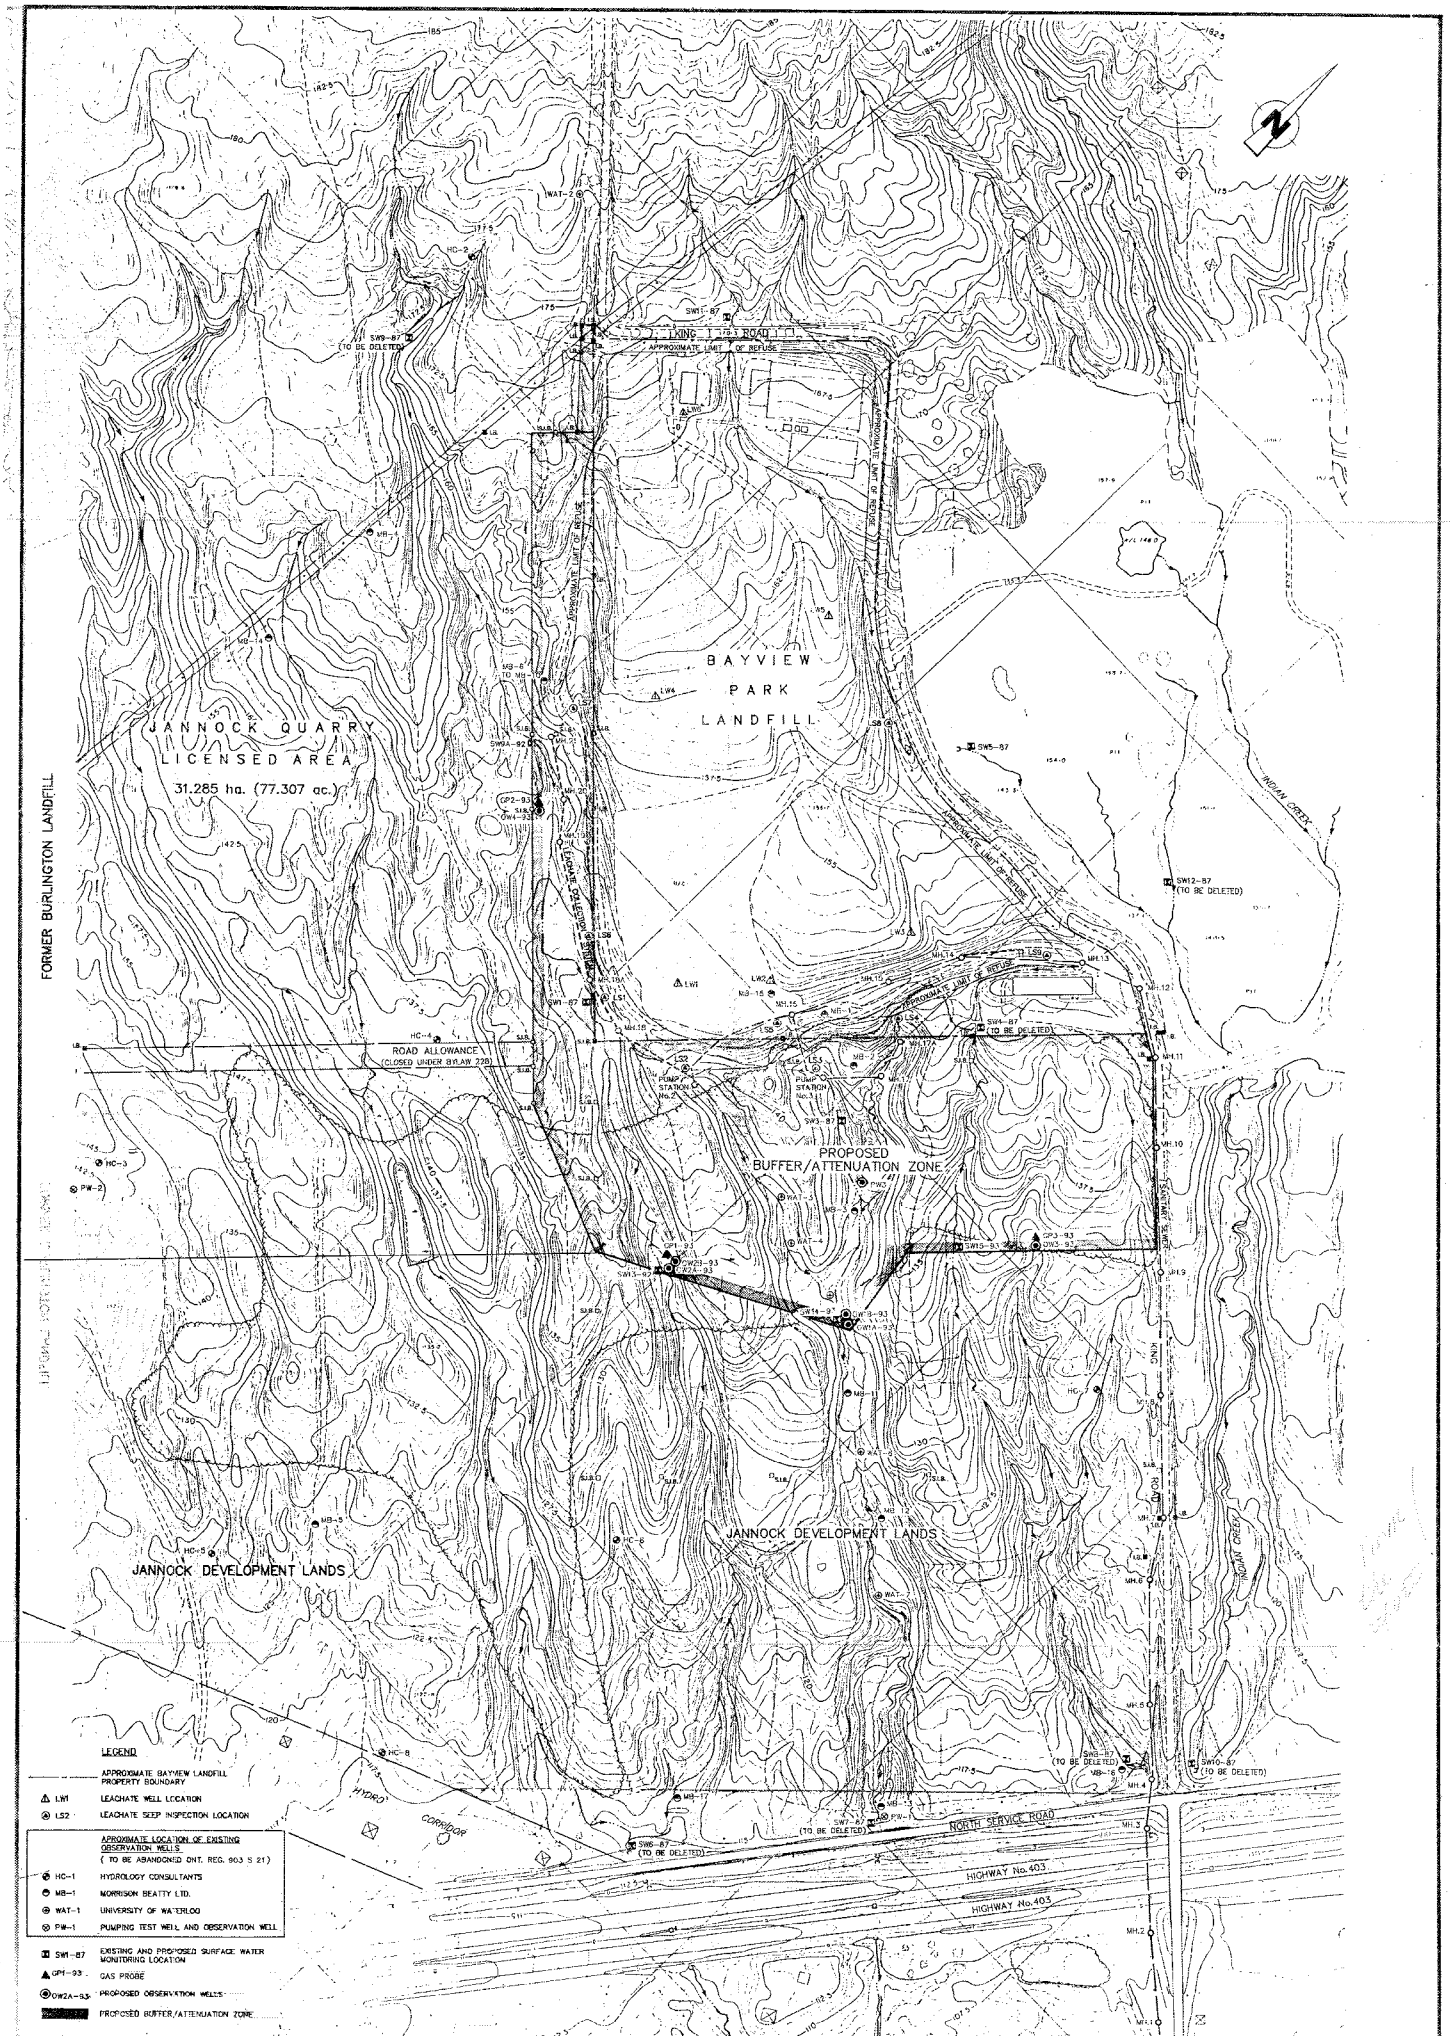
The Ministry of Environment (MOE) witness, Dr. Hughes, stated that MOE policy was based on the assumption of some leachate loss at any landfill site. He also stated that leachate attenuation could be a reasonable use of groundwater "although (he was) unable to give an opinion on whether such a determination is appropriate in this case" (E-928 p 4).

The guidelines for protection of groundwater suggest that, in some cases, there may be reason to allow an off-site attenuation zone (ss. 3.3.2, page 12 of the attachment to E-154). The Board was told that at Site F an available zone already exists, since National Sewer Pipe Limited owns the property where discharge may occur between Highway 403 and the CNR tracks.

Dr. Hughes referred to MOE policies in general, and to the incorporation of the "Reasonable Use Concept" into MOE groundwater management activities in particular:

> "The Ministry may support ...the acquisition of land or an easement for a Contaminant Attenuation Zone only ... where good supplies of water are available... from municipal systems, and the ground water supplies in a particular unit are marginal with respect to their quality and/or their quantity"
>
> E-154 Appendix, p 14

site. He had also studied shale around Site F, to assess its stability for stables at Bayview Park, and industrial parks nearby. In Mr. Gray's view, a one meter thick liner would lead to exfiltration of 9 millimeters per year from the landfill, rather than the 8.14 millimeters per year shown on exhibit H-653. According to exhibit H-690 this corresponds to leachate losses of about 2,460 gallons/day, rather than about 2,720 gal/day.



Mr Sobanski drew the attention of the Board to the very high concentrations of U.S.- EPA priority pollutants at the Burlington landfill site (H-40 p 92), compared to the Georgetown or Oakville landfill sites which were closed some years ago. These organics are not found in significant concentrations 25 meters from the site, and the witness could not say whether this meant the organics were not leaving the landfill, or whether there was simply an inadequate amount of time for the contaminant plume to have travelled 25 meters. The problem with loss of leachate is not just its volume, but rather the seriousness of organic contaminants therein. The waste may not be "hazardous", to use Mr. Sobanski's earlier language, but the Board heard no evidence to suggest it was benign. Conditions will be ordered to encourage actions by local governments to reduce toxic organic chemicals in domestic waste, in view of the landfill situation.

Mr. Sobanski felt that the installation of a few pumping wells near the of the North Service Road could successfully intercept and remove any leachate that might escape from the Site F landfill, assuming that the highly fractured zone exists beneath the landfill.

The firm for which Messrs. Crutcher and Petrie work had earlier (1982) recommended control of leachate egress by means of a clay key south of the Bayview site to intercept "the deeper groundwater flow". Mr. Crutcher explained that he thought that phrase meant groundwater flow to a depth of ten feet below the surface. He now considers the 'deeper groundwater flow' to be a zone between 10 feet and 20 feet below grade. Both Mr. Crutcher and Mr. Petrie explained that if the postulated discharge zone is not well defined, then it is not possible to model or monitor Site F.

Hydrogeology - Site Comparison

The fundamental flaw in the Region's hydrogeologic assessment is evident in both the early and late stages, where it appears that unlike situations were compared as though they were the same. The inappropriate comparison is seen in the comparative analysis document:

Dear Mr. Budz:

Re: 1994 Monitoring Report
Bayview Park Landfill Site

Please find enclosed two copies of the above noted report. This report presents and interprets the current and historical surface water and groundwater quality data collected as part of the annual monitoring program.

An Environmental Performance Report for the Bayview Park Landfill was submitted to your office on November 4, 1994. The report documents the need for a rationalized monitoring program and a proposed buffer/attenuation zone for the Bayview Park Landfill. Complete MOEE comments with respect to that report are still outstanding. In the interim, pending MOEE concurrence with the findings of Environmental Performance Report, the 1995 Monitoring Program will be continued as was undertaken in 1994.

Should you have any questions on the above, please do not hesitate to contact our office.

Yours truly,

CONESTOGA-ROVERS & ASSOCIATES

1.0 INTRODUCTION

1.1 HISTORICAL PERSPECTIVE

The Bayview Park Landfill Site (Site) is located on the west side of King Road north of Hwy. 403 in the City of Burlington (COB), as shown on Figure 1.1. The Site was operated as a landfill by the COB from 1957 to 1972. In 1972, the Site was closed under Ministry of the Environment (MOE)[1] Provisional Certificate of Approval No. 210103. The Site is currently operated by the COB as a park facility.

From 1979 to 1985, the MOE performed site inspections which included the collection of samples for chemical analysis from leachate seeps around the Site and the upper reaches of Indian Creek. The MOE's sampling results indicated levels greater than surface water objectives for coliforms and heavy metals, and low levels of chlorinated organic compounds (including PCBs). The sampling results also indicated that the leachate seeps had impacted the water quality in the creek.

In a letter dated May 24, 1985, the MOE requested that COB respond to the observed leachate seeps and apparent Indian Creek contamination. On May 30, 1985, COB requested that Conestoga-Rovers & Associates (CRA) investigate this issue. The results of this investigation were summarized in a report entitled "Bayview Park Landfill/Indian Creek Contamination Investigation, City of Burlington" dated July 1985. This investigation verified the presence of leachate seeps and contaminated groundwater emanating from the Site and impacting surface water. The report identified a need for the implementation of leachate seepage control measures, and a monitoring program that would evaluate the impact of any control measures installed at the Bayview Park Landfill Site.

In a letter to COB dated October 2, 1985 from B.A. Singh, P. Eng., the MOE requested:

---

1 The Ministry of the Environment (MOE) became the Ministry of the Environment and Energy (MOEE) in early 1993.

"A comprehensive monitoring program assessing the impacts and recommending controls for gas and leachate both off site and on site is required. We ask that you submit terms of reference for this program for approval on or before November 15, 1985."

On behalf of COB, CRA prepared a draft "Terms of Reference 1986 Monitoring Program". In November 1985, this report was submitted to the MOE for comment. CRA then revised and implemented the 1986 monitoring program to reflect the general intent of the MOE comments.

Concurrent to the above, CRA designed a leachate collection system (LCS) to control leachate migration. The LCS was approved under MOE Certificate of Approval No. 3-0819-86-007 (Appendix A) dated July 16, 1986. The LCS was constructed in 1986-1987.

On July 16, 1986, the MOE revoked condition No. 1 of the Provisional Certificate of Approval No. 210103 dated October 11, 1973 and replaced it with four new conditions. Conditions 1 to 3 dealt specifically with the construction of the LCS. Condition 4 reads as follows:

"The City shall carry out the monitoring and inspection program as approved by the Regional Director with such modification as may be approved from time to time by the Regional Director. On or before March 1st of each year, the City shall file a report with the Regional Director containing an analysis and evaluation of the monitoring and inspection program for the previous year."

Monitoring has been undertaken since 1986 and eight annual monitoring reports have been submitted to the Director as per Condition 4 and are listed within References provided within this report.

1.2 HISTORICAL MONITORING PROGRAMS

The 1986 monitoring program was prepared to evaluate the present environmental impact of the Bayview Landfill Site on surface

water, and to provide a basis for evaluating the effectiveness of the LCS. The program included: landfill gas monitoring, leachate levels, leachate seep inspections, and the sampling of 10 surface water locations on a quarterly basis for general chemistry. In addition, 10 surface water and sediment samples were sampled on an annual basis for priority pollutant analysis.

Groundwater monitoring was not conducted in 1986 in order that a comprehensive review could be undertaken of the significant groundwater data base that had been developed for the adjacent National Sewer Pipe (NSP) lands to the southeast (which was designated as the proposed Halton Regional Landfill Site F). This comprehensive review of the groundwater database was undertaken as part of the 1986 monitoring program.

Due to the nature of the underlying near surface fractured shale bedrock and the natural poor water quality (i.e., very high chlorides, sulphate, total dissolved solids) it was generally stated that it may not be possible to delineate the extent of groundwater contamination. However, it was ultimately determined that through the presence of organic nitrogen or synthetic volatile organic compounds (VOCs) an approximation of the downgradient extent of contamination be examined.

As a result of the database review, a groundwater component to the annual monitoring program was implemented as part of the 1987 monitoring program. The groundwater component involved the collection of groundwater samples from selected well nests for the analysis of nitrate, nitrite, TKN, and free ammonia. In addition a limited suite of VOCs were analyzed at selected groundwater locations on an annual basis.

The 1986 Monitoring Report largely concluded the following:

1) Prior to the construction of the LCS, surface leachate discharge from the Site had exerted a measurable impact on surface water quality downstream of the Site. However, the impact could not be attributed to leachate seepage alone.

2) No polychlorinated biphenyls (PCBs) were detected in any of the leachate, water, or sediment samples.

3) Groundwater contamination as delineated by organic nitrogen and trichloroethane extended downgradient to, and possibly beyond, Highway 403.

The 1987 monitoring program concluded amongst other considerations that the installation of the LCS had resulted in a reduction of the impact on the surface water quality, however more data was required to further quantify this reduction. Impaired surface water quality was noted at background locations as well as downstream of the Site. No PCBs were detected at any surface water sampling locations. Furthermore, all major leachate seeps identified in 1986 and in 1987 had been contained. It was also determined that organic nitrogen was not a diagnostic indicator of groundwater contamination at this Site and concluded that the source of toluene concentrations within the groundwater be further documented. The recommended 1988 monitoring program included a re-evaluation of groundwater monitoring locations so as to ensure that the wells were screened within the active groundwater flow zones originating from the Site. In addition, those wells completed with suspect well construction materials, such as glued joints, were deleted from the program.

The 1988 report generally reiterated the same conclusions as previously outlined in the 1987 report. Salient conclusions included that the operation of the LCS had resulted in the reduction of impact on the surface water quality, however, more data would be required to fully evaluate the effects of the collection system. The report further concluded that bacteriological parameters were not a useful indicator of groundwater contamination. Also, off-Site groundwater appeared to be characterized by the sporadic occurrence of volatile organics at trace levels which were largely attributed to a natural source. No PCBs were detected within the surface water and further evaluation of background surface water quality was also required. It was further recommended that a refinement in the groundwater

monitoring network be undertaken to conduct widespread sampling of the shallow or active groundwater flow zone.

The conclusions presented within the 1989 report are generally consistent with those presented as part of previous reports.

The MOE provided comments on the 1990 and 1991 Monitoring Reports on November 5, 1992, with the primary MOE comments presented below:

- "It is very difficult to determine the impacts of leachate on the groundwater system at this Site because of poor background water quality and complex fracture characteristics of the underlying shales. The monitoring program conducted in 1990 and 1991 needs to be continued in order to expand the existing groundwater database. This will enable a more confident interpretation of the groundwater system in the future."

- "It is acceptable to measure leachate levels twice per year instead of four times per year provided there are no noticeable changes to leachate levels in the future."

Consistent with previous reports, the 1992 Monitoring Report found the occurrence of VOCs in leachate and groundwater to be sporadic and characterized by low or trace levels. There was a documented minor impact on general chemistry surface water quality immediately downstream of the Site. In 1992 it was also concluded that surface water quality downstream of the Site along the North Service Road is comparable to background quality, and persistent change in leachate elevations in leachate wells was not evident since installation of the LCS.

The 1993 Monitoring Report concurred with previous monitoring reports, indicating a minor impact of general chemistry parameters in surface water immediately downstream of the Site. Bacteria levels within the surface water were attributed to an upgradient surface water/groundwater source. Comments from the MOEE on the 1993

Monitoring Report and CRA Responses to the comments are contained in Appendix B.

In summary, the effectiveness of the leachate collection system has been demonstrated, and historical overland leachate seepage has been controlled and collected. The impact of the Site on groundwater quality has been difficult to assess due to the naturally poor groundwater quality and lack of proven and effective inorganic indicator parameters of leachate contamination.

1.3 CURRENT SITUATION

The property adjacent (to the southeast) of the Site was formerly owned by NSP. The NSP property was purchased by Jannock Ltd. through its subsidiary 873805 Ontario Inc. Jannock Ltd. is interested in establishing a brick factory and quarry within the licensed portion of the property and will also pursue the development of industrial land fronting on the North Service Road. As such, COB and Jannock Ltd. have undertaken a joint technical review of the performance and impacts of the Site. This review allows COB to determine the most appropriate buffer zone, monitoring requirements, and contingency measures for this closed landfill Site. The results of this review also allows Jannock Ltd. to evaluate the suitability of development of its adjacent lands south of the landfill in accordance with the provisions of the Ministry of the Environment Policy 07-07.

A joint COB/Jannock Ltd. report entitled, "Concept Proposal, Bayview Park Landfill Buffer Zone/Monitoring Requirements and Development of Lands of South of Bayview Park Landfill" dated January 1993, was prepared by CRA/Golder Associates and subsequently presented to the MOEE on February 8, 1993. The MOEE advised that they agree in principal with the Concept Proposal in a letter to COB dated February 23, 1993.

As part of the evaluation of Site Environmental Performance as outlined within the January 1993 Concept Proposal, newly installed observation wells OW1A/B-93, OW2A/B-93, OW3-93, and OW4-93 were sampled on two occasions in April 1993. Proposed surface water sample locations SW9A-93, SW13-93, SW14-93, and SW15-93 were sampled on one occasion in April 1993. The above groundwater and surface water results are presented in Appendix G.

Subsequently, a report entitled "Environmental Performance Report, Bayview Park Landfill" was prepared and submitted to the MOEE (J. Budz) on November 4, 1994. The purpose of the Environmental Performance Report is to present an environmental performance evaluation and rationalized monitoring program for the Bayview Park Landfill Site, based on the proposed Buffer/Alternative zone and recognition of the proposed adjacent land use developments. Complete comments with respect to the Environmental Performance Report are still outstanding.

1.4 HYDROGEOLOGIC BACKGROUND

As previously outlined, the Site lies adjacent to lands formerly owned by NSP (and currently owned by Jannock Ltd.) which were designated as "Site F" by the Region of Halton in their Waste Management Master Plan. Immediately west of Site F lies the Region of Halton Burlington Landfill Site (BLF). A number of hydrogeological reports addressing Site F, the adjacent BLF and the Site were presented as part of an Environmental Assessment Board Hearing for the selection of a new regional landfill site (CRA, 1988a; Feenstra, 1988; Gartner Lee, 1988: Geocon, 1987 and Trow, 1986).

In summarizing the above noted reports, the Site hydrogeology is characterized by a weathered and fractured shale mantle overlying a less fractured and relatively lower permeable shale bedrock. The fracture pattern within the shale mantle displays considerable variation both vertically and laterally across the Site. The pattern of groundwater flow within this fractured shale mantle is therefore expected to be complex. As shown by Feenstra (1988) the shallow or active groundwater flow system is

shown by Feenstra (1988) the shallow or active groundwater flow system is characterized by low chloride concentrations (<2,000 mg/L) relative to the underlying deep groundwater flow system found at the Site. As shown by Feenstra (1988) this flow system varies from as much as 20 m thick at HC4-85 to 0 m at HC8-85. In general this system varies from 0 to 5 m in thickness downgradient from the Site. Groundwater in this system generally flows laterally through a complex network of interconnected fractures with discharge to surface water bodies.

The underlying deep groundwater flow system is characterized by strong downward gradients and saline groundwaters. Chloride levels commonly exceed 10,000 mg/L in the underlying deep groundwater flow system.

A number of well nests and pumping wells were installed by Trow (1986) during the course of the hydrogeologic investigations on Site F. Of these wells, HC4-85, HC9-85, PW1, and PW3 lie generally downgradient of the Site and were incorporated into the 1988 Monitoring Program. In addition, well nests HC6-85 and HC7-85, which also lie generally downgradient of the Site, were incorporated into the 1989 Monitoring Program. In 1994, monitoring of these wells was continued except at HC6-85 (HC6-2, HC6-3) which had destroyed since April 1990. Geologic logs and observation well completion records for these wells are presented in Appendix C.

2.0 1994 MONITORING PROGRAM

The 1994 monitoring program was designed to continue to evaluate the effectiveness of the leachate collection system (LCS) and to determine if the groundwater and surface water downgradient of the Site is measurably impacted at the monitoring locations. The 1994 monitoring program consisted of the following components:

1) surface water monitoring;
2) leachate well monitoring;
3) leachate collection system monitoring;
4) off-Site groundwater monitoring; and
5) leachate seep inspections.

The monitoring program implemented in 1994 is outlined in Appendix D. Each of the five components of the monitoring program are presented with respect to sampling locations, frequency, monitoring requirements, and analytical requirements if applicable. The monitoring events in 1994 took place on April 19, 1994, July 6 and 7, 1994, and October 13, 1994.

2.1 SURFACE WATER MONITORING

The 1994 regular monitoring program provided surface water quality monitoring at 12 locations. These locations are provided on Figures 2.1 and 2.2. Samples were scheduled for collection during wet and dry weather, in April and July respectively, and in October if locations were dry during the July event.

Surface water samples were collected from all locations in April 1994 except for SW3-87 and SW11-87 which were reported as being moist without significant accumulations of water, and at SW4-87 where stagnant water conditions were observed. Samples were collected during the July sampling event from all of the surface water locations except for SW3-87, SW4-87, SW6-87, SW11-87, and SW13-89 which were dry. In October 1994, all

surface water sample locations were reported as dry. General Chemistry, VOCs, and Bacteriological parameters that were analyzed are presented in Table A.1 of the monitoring specifications contained in Appendix D.

2.2 LEACHATE WELL MONITORING

The six leachate well locations, LW1 to LW6, inclusive are shown on Figure 2.1. The leachate levels were measured on two occasions (April and July 1994) so as to evaluate the LCS. In addition, leachate well depths were measured. Levels were not obtained in LW4 as this well has been obstructed since 1991. In July 1994, a level was not obtained in LW2 due to the presence of condensate, on the solinst and "oil" like material in the well.

2.3 LEACHATE COLLECTION SYSTEM MONITORING

Leachate samples were collected from MH15 in April 1994. The manhole was reported dry in October 1994. The parameters that were analyzed are outlined in Table A.1 of the Monitoring Specifications (Appendix D).

Monitoring of the leachate flow at MH14 was not performed in 1994 as an estimated steady state flow of 0.43 m^3/day was established prior to the 1992 Monitoring Report. Leachate discharge flow rates for Pumping Stations #2 and #3 as well as MH14 were recorded for the entire year by COB (Appendix E). Precipitation data for the Hamilton Region are summarized in Table 2.1 in order to provide comparative information with respect to LCS annual pumped volumes versus the annual and average precipitation amounts.

2.4 OFF-SITE GROUNDWATER MONITORING

Monitoring of groundwater off Site was performed in 1994 to evaluate the presence of any measurable contamination of groundwater downgradient of the Site. The off-Site groundwater monitoring consisted of two components:

1) obtaining representative groundwater data for the shallow or active groundwater flow zone at the pumping wells; and
2) conducting widespread sampling of the shallow or active groundwater flow zone.

Two sampling events were conducted for off-Site monitoring; one event during each of April and July. Eight groundwater monitoring locations, including two pumping wells, PW1, PW3, and a total of six observation wells at three nest locations (HC-4, HC-7, and HC-9) were sampled. Off-Site groundwater monitoring locations are shown on Figure 2.3. However, as reported in April 1990, sampling at nest location HC6 was not possible as these wells have been destroyed. Also, it was determined in April 1994 that well HC4-3 has been destroyed. It is proposed that these wells will be replaced as part of the revised monitoring program as outlined in the January 1993 Concept Proposal and the November 1994 Environmental Performance Report. The parameters that were analyzed are provided in the Monitoring Specifications in Appendix D.

The two pumping wells (PW1 and PW3) were monitored so that representative samples of the groundwater quality downgradient of the Site could be measured. Prior to sampling, each pumping well was pumped for 5 hours. The samples were then obtained using a pre-cleaned bailer.

Prior to sampling, each observation well was purged, removing a minimum of three times the standing water volume in the well or until dry. In the event that the well was purged dry prior to achieving the three well volumes, the groundwater was allowed to recover to a level adequate for sample collection.

2.5 LEACHATE SEEP INSPECTIONS

There are nine historic leachate seep locations on Site. Seep inspections were performed on three occasions throughout 1994 (April 19th, July 7th and October 13, 1994) for seepage reoccurrence at historic seep locations and for the presence of new leachate seeps around the entire Site. Leachate Seep Inspection Reports for 1994 are presented in Appendix F.

3.0 LEACHATE COLLECTION SYSTEM RESULTS

3.1 LEACHATE WELL LEVELS

As mentioned previously, leachate level measurements were conducted on three occasions throughout 1994. Historical and current leachate level data are summarized in Table 3.1 and schematically illustrated on Figure 3.1. As noted on Figure 3.1, the LCS was placed on line in December 1986.

Leachate elevations at LW1 have remained reasonably consistent since the inception of operations at the LCS. Historically, fluctuations are attributed to seasonal variations in precipitation.

At LW2, the leachate elevations have historically remained either just above or below 137 metres above mean sea level (m AMSL) with a few exceptions. On three occasions since installation of the LCS, November 1988, November 1989, and July 1992, the leachate elevation has exceeded 141 m AMSL. These exceptionally high leachate elevations may reflect seasonal trends and/or may be a function of variations in the pumping rates of the LCS. A level was obtained in April 1994 which was consistent with historical measurements. The reported presence of "oil" like product at LW2 in July 1994 did not allow for the measurement of the leachate levels at this time. It is now recommended that a plopper and tape assembly be utilized to measure liquid levels at this and all leachate monitoring well locations.

Leachate elevations at LW3 are historically fairly consistent and have continued to be so throughout 1994.

Leachate well LW4 has been obstructed since 1991 and as such no recent leachate elevation levels have been measured. Pre-1991 leachate elevations are fairly stable with no obvious increasing/decreasing elevation trends being noted.

Leachate elevations at LW5 remained relatively stable throughout 1994 and consistent with historical data.

The leachate elevations in LW6 appears to show some seasonal variation similar to LW5 with decreasing levels in the summer and fall.

Leachate contours presented on Figure 3.2 were developed by utilizing leachate levels taken in July 1994 from all available leachate well locations. The leachate levels range from 142.11 to 165.26 m AMSL. As shown on Figure 3.2, the leachate flow is primarily in a southeasterly direction and mimics the underlying topographic slope. The average horizontal gradient across the Site for July 1994 was calculated to be 0.06 m/m. There has been no significant change in the horizontal gradient from initial measurements obtained in January 1986 (0.06 m/m), prior to installation of the collection system.

The leachate elevation monitoring results suggest that any decline in leachate elevation, as a result of the operation of the LCS is minimal. Moreover, the volume of leachate within the Site has not been significantly reduced. As will be discussed in Section 3.2 the LCS has proven effective in collecting leachate which historically seeped from the Site via toe of slope seepages. Leachate level monitoring should therefore be continued at a frequency of twice per year (April and July) in order to further monitor leachate levels at the Site.

3.2 LEACHATE SEEP INSPECTIONS

Leachate seep inspections were performed at the Site on three occasions: April, July and October throughout 1994. Inspections were inadvertently overlooked as scheduled in January 1994. The inspections are a continuation of the leachate seep inspection program established in 1986. On each occasion, a visual inspection was conducted at nine locations where leachate seepage has occurred historically. The inspection locations are identified on Figure 3.3. Leachate seep inspection reports summarizing

information pertaining to the condition of the seep locations were prepared during each inspection. The leachate seep inspection reports are provided in Appendix F.

As indicated in the 1986 Monitoring Report, leachate seepage was not observed at any inspection location during the late fall and early winter period following installation of the LCS. Although these locations did not exhibit any leachate seep discharge, they continued to be referred to as Leachate Seeps Nos. 1 through 9 for reference purposes during the 1987 through 1994 inspection programs.

Throughout 1994, leachate seepage was not observed at any of the nine historic leachate seep locations monitored. Soil patches at these three locations were however, noted as being wet to moist with no obvious overland seepage. These locations were LS1, LS7, and LS8.

In 1992, leachate seepage was observed at LS1. As a result, corrective measures including installation of riprap clear stone and drainage tile connected to the LCS were implemented in July 1992 in the vicinity of LS1. No seepage was observed at LS1 during the latter part of 1992 or during 1993. However, a localized wet soil area was observed at LS1 in both April and July 1994. The area was visually inspected, and reported to not emit a characteristic leachate odour or have a visible sheen in April 1994, however, a slight odour and slight sheen were observed in July 1994. The LS1 leachate seep location was observed to be dry in October 1994.

Soil dampness was observed at leachate seep location LS7 in April 1994. Visual inspection of the area indicated no characteristic leachate odour or visible sheen were present. Soil dampness was not evident in July 1994 or October 1994 and this location was recorded as being dry

Leachate seep location LS8 was reported as being damp in April 1994. No surface flow of liquid was reported. The dampness could have been due to precipitation that may have ponded at this location as no characteristic leachate odour or sheen was observed. This situation was

previously observed in July 1993. The location was dry in both July and October 1994.

3.3 PERFORMANCE OF THE LEACHATE/SHALLOW GROUNDWATER COLLECTION SYSTEM

The LCS is located along the south and west (downgradient) sides of the Site. The LCS consists of perforated pipe collectors and french drains. The pipe collectors generally are located parallel to the toe of the slope of the landfill at a depth of 4 m. The collector pipe consist of polyvinyl chloride (PVC) perforated pipe contained within a 2 m trench backfilled with clear stone. French drains are connected to the collector trenches and run up the landfill slopes into the refuse directly beneath the low permeable cover soils. The french drains are located where persistent leachate seepage through the cover previously occurred. A total of approximately 500 m of collector pipe and 350 m of french drains are in place. As noted earlier, the installation of the sideslope drainage swales and repair to the final cover in the vicinity of LS1 were undertaken in July 1992.

The collector pipe are connected to two pump stations located in deep ravines along the south side of the Site. The pump stations discharge leachate to the Region of Halton Sanitary sewer system for final treatment at the Skyway treatment plant. The King Road Sanitary sewer was extended beneath Highway 403 and up King Road to the Site. Approximately 800 m of gravity sanitary sewer were installed to accept leachate from the Site. The collected leachate is pumped through small diameter forcemains (2-inch and 3-inch) to the gravity sewer. Historically, flow measurements were obtained monthly from the two pump stations and measurements were recorded by COB staff. In 1994 flow measurements were recorded by COB staff on nine occasions.

Each pump station consists of two pumps which engage on an alternating basis. An elapsed time meter records the run time for each of the two pumps at each of the two stations. Therefore, similar elapsed time readings for each pump indicate normal operation. A copy of all the 1994

pump readings are provided in Appendix E. As noted in Appendix E, Pump No. 2 in Station No. 2 was shutdown during the period of October 1st to November 25, 1994 for repairs. The total pump hours and total flows for Station No. 2 and Station No. 3 are presented in Table 3.2. The estimated flow for the short lateral collector that discharges to the gravity sewer at MH14 is also presented in Table 3.2. It is evident that the short lateral collector is a small contributor to the total estimated flow of the collection system. Due to prohibitive confined space entry requirements and cognizant of collected data over the previous 4 years, it was recommended in the 1990 Monitoring Report that an estimated rate for the short collector be utilized as part of COB reporting and payment for treatment to the Region of Halton. This estimated rate is 0.43 m^3/day.

Based on the sum of the pumped volumes at Pumping Stations 2 and 3 as well as the flow from the short collector at the MH14 weir estimates the total volume of leachate removed by the system is estimated to be 54,044.83 m^3 for the period January 22, 1994 to December 27, 1994. It should be noted that the operational pumping hours and the total volume of leachate discharged has significantly decreased from the reported value in 1993 (100,198.63 m^3), but is comparable to the value reported in 1992 (41,442.58 m^3). The average 1987 to 1994 annual leachate discharge volume is approximately 70,500 m^3. Table 3.3 summarizes the historical leachate discharge volumes to the Regional sanitary sewer.

4.0 ANALYTICAL RESULTS

A description of the sampling program is outlined in the 1994 Site Monitoring Specifications provided in Appendix D. All surface water, groundwater, and leachate samples collected during this investigation were analyzed by the following laboratories:

General Chemistry	CRA Analytical Services (CAS)
Bacteria	NovaMann
Metals	NovaMann
VOC	NovaMann
Base/Neutral/Acid Extractables (BNAs)	NovaMann
Pesticides/PCBs	NovaMann

The data base containing the current and historical analytical data is compiled in Appendix G. These data were assessed and validated based upon a Quality Assurance/Quality Control (QA/QC) Program. These results are discussed in the following section of this report.

4.1 QUALITY ASSURANCE/QUALITY CONTROL PROGRAM

The analytical data received was assessed and validated by CRA's QA/QC program based upon a review of standard quality control criteria, which include field blank analyses, duplicate sample analyses, travel blank analyses, sample holding times, and laboratory QA/QC procedures.

Field blanks were used to provide an indicator of potential sources of target analyte contamination of the samples during sampling and analysis. A field blank was prepared by pouring Type I deionized water, supplied by the CRA laboratory, into a sample bottle while on Site. According to USEPA guidelines when target analytes are detected within the field blank, only analytical results which were greater than five times the levels reported in the field blank are considered to be true positive detections. Affected results are qualified as "U" - not detected above sample quantitation limit. In

essence, these guidelines correct the reported laboratory method detection limit for contributory influences not reflected in the limitations of the analytical method. The sample quantitation limit (SQL) is the true confidence threshold. Analytes detected at levels below the SQL are not regarded as being true positive detections.

In order to assess sampling variability, duplicate samples were also collected and submitted to the respective analytical facility as part of each sampling event.

Travel (trip) blanks were also collected as part of the QA/QC program. These samples were analyzed for VOCs. The purpose of a trip blank was to determine if cross-contamination occurred during shipping. The laboratory would prepare the trip blanks and send them to the field where they would be left unopened.

Allowable holding time of a sample is the maximum time, beginning with sample collection, which can be allowed to elapse before extracting or analyzing a sample. By comparing the collection date of all samples with the reported date of extraction or analysis, the actual holding time is determined and compared to the allowable holding time.

Analysis of laboratory duplicates, blanks, and check samples were also part of the laboratory QA/QC program. Laboratory duplicates consisted of laboratory prepared duplicates of field samples. The duplicates were prepared by subdividing the sample into two individual samples so that homogeneity was achieved. The purpose of these duplicates was to validate the precision of the laboratory analytical methods employed.

The laboratory performing the analysis would prepare a laboratory blank consisting of de-ionized water on the day the collected samples were to be analyzed. The objective of this blank was to determine the existence and magnitude of contamination, if any, occurred within the laboratory.

The analytical assessment and validation reports are presented in Appendix H. A summary of data qualifications is provided in Table 2 in Appendix H. The validation reports indicate that selected analytical results required qualifications in 1994. These qualifications were due to the following:

1) low level detections of certain metal analytes (zinc, iron, cadmium, copper, tin, lead, nickel, and aluminum) in the April field blank and lab blank samples;

2) a degree of variability in duplicate general chemistry sample results as part of the April sampling event; and

3) low laboratory method spike recovery for aldrin for leachate samples collected in April 1994.

4.2 SURFACE WATER

The Site monitoring specifications dictate that surface water sampling is to occur in wet weather conditions in April, and dry weather conditions in July, however, if surface water sampling locations are dry in July, surface water samples would be collected in October. These sampling condition specifications were observed and adhered to for April and July sampling in 1994.

There are 13 surface water sampling locations at the Site. During the installation of the LCS in 1986, surface water sampling point SW2 was contained by the collection system, and thus no longer exists. In April 1994, samples were collected from 9 of the 12 remaining sampling locations, with locations SW3, SW4, and SW11 being reported as containing stagnant water only. In July 1994, samples were collected from seven of the 12 remaining sampling locations, with locations SW3, SW4, SW6, SW11, and SW13 reported as dry. All locations were dry in October 1994. All historical

and present surface water data has been recorded in the data base provided in Appendix G.

Field measurements of pH and conductivity were obtained for all monitoring locations in 1994. All samples were analyzed for the following general chemistry parameters:

- alkalinity;
- ammonia nitrogen;
- chloride;
- total kjeldahl nitrogen (TKN);
- phenols; and
- sulphate.

Un-ionized ammonia concentrations were calculated from total ammonia results by applying a correction factor based on the temperature and pH of the surface water. This method of determining un-ionized ammonia concentrations is outlined in "Water Management - Policies, Guidelines, Provincial Water Quality Objectives of the Ministry of Environment and Energy" (July 1994).

Total kjeldahl nitrogen (TKN) is a measure of all the nitrogen in the trinegative state. It is primarily a measure of nitrogen present in the organic form such as proteins, amines, and urea, as well as nitrogen present as free ammonia. The organic nitrogen fraction can be estimated by taking the difference between the free ammonia and the total kjeldahl nitrogen results. Sewage and runoff from agricultural areas where fertilizers have been used are the primary sources of TKN besides the natural nitrogen fixation and anaerobic nitrate reduction processes. The degradation of food wastes may also be a source of TKN.

Priority pollutant VOC indicators and bacteriological parameters were also analyzed. Historically, fecal coliforms, total coliforms, and fecal streptococci were the bacteriological parameters analyzed. With the issuance of the updated Provincial Water Quality Objectives by the MOEE in July 1994, Escherichia coli (E. coli) were added to the parameter list. The

MOEE standard indicated E. coli is the most suitable and specific indicator of fecal contamination. The analysis of fecal and total coliforms will be continued at the Site to allow for monitoring trends in the water quality with time.

Coliform group bacteria are present in the gut and feces of warm blooded animals. An indication of the remoteness of the source of coliforms is the relative amounts of fecal coliform/and non fecal members of the coliform group. Non fecal members of the coliform group may be expected to survive longer then the fecal members of the group in the unfavourable environment provided by the water. The presence of total coliforms in water is not a specific indication of sewage as fecal pollution but may also indicate soil runoff and also contact with food wastes.

A complete listing of all parameters analyzed are outlined in the 1994 Site Monitoring Specifications presented in Appendix D.

As reported in the 1989 Monitoring Program Report (CRA 1990), the surface water samples collected in 1989 were during a period of relatively large surface water flow and as such may reflect the improved water quality due to dilution. This was considered when comparing these results.

It should also be noted that the surface water monitoring analytical list was refined in 1988, as such hardness, iron, DOC, nitrite and nitrate were removed from the analytical parameter list.

4.2.1 General Chemistry

Background Surface Water Quality Locations
SW9, SW11, and SW12

The sampling point SW9 was established to define the local (background) surface water chemical characteristics in order to

differentiate between any impacts related to the landfill and elevated concentrations typical of the area. Locations SW11 and SW12 were added in the 1987 Monitoring Program so that additional background surface water quality information could be established. A summary of historical and current surface water quality at the above-noted locations is presented in Table 4.1.

Comparison of historical results at SW9 with the current data show 1994 values for conductivity, alkalinity, chloride, sulphate, and TKN are comparable to historical values but have shown an increasing trend over the period 1992 to 1994. The concentrations of coliforms measured in April 1994 are comparable to historical results, but show an increase in July 1994. Ecoli counts of 540 were detected in the July 1994 sample collected at SW9. This strongly indicates an upstream source of animal wastes. Concentrations of un-ionized ammonia are also higher than available historic results. Since this is a background surface water monitoring location, an upstream groundwater and/or surface water source for TKN, coliform and unionized ammonia analytes is indicated.

At SW11, samples have only been obtained since 1989 as this location was dry throughout 1987 and 1988. This location was also dry throughout 1994. Historic results indicate concentrations of chloride, TKN, and coliforms are present. Again, as this is a background surface water monitoring location, there is an upstream groundwater/surface water source of these parameters.

The 1994 results for SW12 indicate increases in TKN and coliform concentrations over historic results. The Ecoli count was measured at greater than 1,600 which again strongly indicates an upstream source related to animal wastes. Also, in April 1994 the reported un-ionized ammonia concentration represents a significant increase (from not detected since 1991 to 3.2 µg/L in April 1994); however, in July 1994 ammonia is not detected. Again, an upstream source for TKN, coliform and unionized ammonia is indicated.

For the parameters analyzed, the background surface water quality results in 1994 are below their respective Provincial Water Quality Objectives (PWQOs) with the exception of July 1994 results for coliforms. General chemistry and bacteria results indicate that background water quality has generally deteriorated throughout 1992 to 1994. These results contrast a pattern of progressive improvements in background surface water quality since monitoring began in 1986. Future analyses will help to clarify whether these results values are anomalous or the start of a trend to poorer background water quality.

Leachate Seep Surface Water Locations
SW1, SW3, and SW4

Location SW1 monitored surface flow and leachate seepage in 1986 near the southern toe of the Landfill area. As shown on Figure 2.1 this point lies immediately outside the collection system. Locations SW3 and SW4 also monitored the surface water near the southern toe of the Landfill Site in 1986, but were relocated at a downstream position in 1987. Both SW3 and SW4 were dry or contained stagnant water, throughout the period between 1987 to 1994. It is reasoned that SW3 and SW4 are essentially dry due to the performance of the LCS. Comments from the MOEE in Appendix B suggest moving SW3 and SW4 further downstream to facilitate sample collection. The purpose of the continued monitoring of these locations is to demonstrate that the leachate collection system is effective in the containment of former seepage locations. The observation that these locations are essentially dry confirm that the leachate collection system is operating effectively. At location SW2 leachate historically emanated from the toe of the slope at the Site but was contained in 1986 and now discharges directly into the leachate collection system. A summary of the historical and present surface water quality at SW2 is presented in Table 4.2.

The reported water quality at SW1 continues to show improvement in 1994 as compared to that reported prior to the construction of the leachate collection system in 1986. However, the 1994 results are generally higher than the 1993 results. The reported concentrations of chloride showed a marked decrease from 1993 to 1994. However, the concentration of TKN and coliforms has shown a marked increase in 1994

compared to 1993. Concentrations of other parameters remained relatively consistent.

The 1994 concentrations at SW1 are comparable to or lower than those recorded at the background upstream location (SW9) with the exception of detected unionized ammonia, TKN and total coliform concentrations. Historically, the concentrations of most parameters at SW1 have been slightly elevated compared to SW9. This suggests some minor landfill derived impact or additional loading as a result of groundwater discharge of water that has been impacted by unionized ammonia, TKN and/or total coliform bacteria. Ecoli counts are comparable at both background location SW9 and landfill vicinity SW1 monitoring locations.

Discharge to East of King Road, SW5

Surface water location SW5 is located at the culvert which runs east beneath King Road and discharges on the adjacent Jannock quarry property. Much of the Bayview Park surface water flow drains to this point. Some remediation was conducted around SW5 in 1986/1987 in the form of soil cover, regrading and ditching.

The general chemistry parameter results at SW5 throughout 1986 to 1994 are presented in Table 4.3. Comparing the 1993 results with the 1986 results, indicates that an overall improvement in water quality has occurred. Detected general chemistry parameters generally decreased from 1986 until anomalously high values were reported in July 1992.

Water quality at SW5 in April 1993 and April 1994 showed an improvement since July 1992, but again a marked increase in general, chemistry analytes such as chloride, TKN, ammonia and coliform bacteria concentrations, was observed in July 1994 as compared to April 1993 and April 1994. Ecoli counts for a sample collected at SW5 were determined to be 540 as part of the July 1994 sampling event. The samples obtained at SW5 in July 1992 and July 1994 are the only two historic samples collected from this location during the summer months. SW5 has historically been dry during

this time period. This suggests a possible seasonal component to the observed fluctuations, with higher concentrations observed during periods of lower flow (less available dilution).

SW5 has historically shown elevated levels of conductivity, alkalinity, chlorides, TKN, sulphate, and coliforms when compared to the background location, SW11, suggesting minor landfill derived surface water impacts. Surface water location SW11-91 was reported as dry for the April 1994 and July 1994 monitoring events. The 1994 surface water quality at SW5 meets the applicable PWQO for the analyzed list of parameters (with the exception of coliform bacteria).

King Road and North Service Road, SW10

Surface water point SW10 is located at the northeast corner of King Road and North Service Road, approximately 600 m downstream of SW5. The headwaters draining to SW10 are generally located immediately to the east of the Site, but include some surface water drainage from the Site, as measured at SW5.

A summary of historical and current surface water quality at SW10 is presented in Table 4.4. Surface water quality at SW10 has improved since 1986 with the exception of general chemistry analyte, TKN. Values of TKN reported in 1994 (ranging from 0.35 to 1.34 mg/L) are higher than those in 1986 (ranging from 0.25 to 0.49 mg/L).

In April 1994, general chemistry analytes including conductivity, chloride, and sulphate demonstrated decreased concentrations over those reported in 1992 and 1993. General chemistry parameters reported in July 1994 were slightly above concentrations reported in April 1994. Of particular interest is the TKN result (1.34 mg/L) reported in July 1994. This value represents the highest recorded level of TKN at this location. It is noted that levels of TKN have progressively increased throughout 1990 to 1994. Total coliform concentrations reported in July 1994 represent the highest levels since 1989. Ecoli counts at SW10 were in excess of 1,600 for a SW10 sample collected as part of the July 1994 monitoring event.

In comparison with the April 1994 data at the upstream location SW5, location SW10 demonstrates improved water quality for the general chemistry parameters, conductivity, alkalinity, chloride, TKN, and ammonia, but decreased water quality as depicted by increased concentrations of sulphate.

The surface water quality at SW10 meets the established PWQOs with the exception of coliform guideline criteria. No PWQO is available for TKN.

North Service Road Locations
SW6, SW7, and SW8

Surface water monitoring locations SW6, SW7, and SW8 are located along the North Service Road and are downgradient of SW1, SW3, and SW4 respectively (Figure 2.2). These sampling points are located at a point on the stream upslope from any potential influence of road salting from Highway 403. A summary of the surface water quality for SW6, SW7, and SW8 is outlined in Table 4.5.

At SW6 all general chemistry parameters reported in April 1994 are below 1986 values. A general trend of improving water quality has evolved since 1986 with the exception of concentrations of TKN and coliforms.

Comparing SW6 1994 general chemistry values with those reported in 1993 reveals that most parameters have essentially remained the same or decreased slightly. Specifically, concentrations of TKN and coliforms which showed slightly elevated concentrations in July 1993 are decreased in April 1994.

Comparison of April 1994 data with the upstream location SW1, indicate that higher results for conductivity, chlorides, and sulphate were detected at SW6. Lower values of TKN, ammonia, and coliforms were detected at SW6 as compared with SW1.

General chemistry parameter results for SW7 indicate that a trend of continued improved water quality samples since 1986 was interrupted in 1993. The 1994 results are generally comparable to or slightly lower than the 1993 results with the exception of TKN concentrations. Coliform concentrations detected in July 1994 were detected above the applicable PWQOs. Ecoli counts were in excess of 1,600 for a surface water sample collected at this location in July 1994.

At SW8, surface water concentrations in 1994 are comparable to those reported in 1993 and are within the range historically reported. Concentrations of TKN (1.42 mg/L) and ammonia (0.15 mg/L) reported in 1994 are the highest detected concentrations since 1987. Concentrations of coliforms in July 1994 were detected above the applicable PWQOs with Ecoli counts in excess of 1,600.

Aldershot Sampling Location, SW13

Surface water location SW13 is located downstream of the Site, south of Highway 403, near the CNR tracks. This location was incorporated into the 1988 Monitoring Program because of the generally dry conditions encountered in 1987. Some surface drainage from SW6, SW7, and SW8 as well as surface drainage from west of the Site are incorporated at this sampling location. A summary of surface water quality is presented in Table 4.6.

The reported concentrations at SW13 are comparable with historical results, with the exception of a slightly elevated concentration of un-ionized ammonia reported in April 1994. Concentrations at SW13 are generally within the range observed at the upgradient locations, SW6, SW7, and SW8.

4.2.2 Volatile Priority Pollutant Sampling

In April 1994, samples were collected from 9 of the 13 surface water locations for priority pollutant volatile organic compounds

(VOCs) analysis. Surface water locations SW3, SW4 and SW11 were dry, and location SW2 no longer exists. In July 1994, seven surface water samples were collected for VOC analysis, while surface water locations SW3, SW4, SW6, SW11, and SW13 were dry.

No volatile organic compounds were detected in the surface water samples in 1994. The parameters analyzed are outlined in Appendix D. The VOC results are compiled in the data base presented in Appendix G.

MOEE comments in Appendix B related to the question of parameters indicative of leachate such as metals (specifically iron), toluene, and PCBs and stated that these analytes should be incorporated into the monitoring program, so as to gauge any changes in landfill impacts. VOCs including toluene are already analyzed at the surface water monitoring locations. With respect to PCBs, these parameters have been monitored in the surface water in the past and found to generally not be persistently present. Given the natural presence of iron within the iron rich red shale bedrock area over which the surface water directly flows, iron may not be appropriate as an indicator of landfill derived impacts in surface water. Metals, VOCs, pesticides and PCB parameters are monitored in the leachate itself to provide a basis for determining whether or not these parameters are of concern to surface water quality. The results of leachate analysis is provided in Section 4.3.

4.2.3 Summary

Volatile organic compounds were not detected at any surface water locations in 1994. This is consistent with historical results.

General chemistry parameter results indicate that surface water quality has improved since installation of the LCS in 1986. Throughout 1986 to April 1992 a trend of progressively improving surface water quality had developed at a number of locations. This trend was disrupted in

July 1992 when relatively elevated general chemistry values were reported at a number of locations.

The 1994 results indicate that, in general, conductivity, alkalinity, hardness, phenols, chloride, and sulphate concentrations at all surface water locations are comparable to recent historic concentrations and well below 1986 values. Whereas, TKN, ammonia, and coliform bacteria values have generally increased from recent historic data at background, landfill vicinity, and downstream locations. Coliform bacteria concentrations showed a marked increase in July 1994 over historical results at both background, landfill vicinity, and downstream locations.

An upstream/upgradient surface and groundwater source of coliform, ammonia, and TKN is indicated.

A comparison of upstream and downstream surface water quality for April 1994 and July 1994 is provided in Tables 4.7 and 4.8, respectively. The landfill appears to be affecting surface water quality as a result of shallow impacted groundwater discharge with respect to increased chloride, ammonia (including un-ionized ammonia), and TKN concentrations at landfill vicinity surface water monitoring locations based on a comparison of upstream and downstream monitoring points. Un-ionized ammonia concentrations are below the PWQO of 20 µg/L. Currently, no PWQO is available for chloride or TKN.

Concentrations of coliforms (including E. Coli) are found above PWQOs at upstream, landfill vicinity, and downstream monitoring locations.

4.3 LEACHATE/SHALLOW GROUNDWATER COLLECTION SYSTEM MONITORING

Leachate was sampled on a single occasion in 1994 for the analysis of all parameters listed in Table A.1 of the 1994 Site Monitoring Specifications located in Appendix D. Leachate samples were collected at MH15 in April 1994. The manhole was dry in October 1994. The sample was

collected at the base of the manhole while the collection system was pumping. The short lateral collectors that joins the main system at MH13 and MH14 were not sampled due to "confined space" entry restrictions. All historical and present leachate chemistry results are presented in the data base in Appendix G.

4.3.1 Metals and General Chemistry - Leachate

The results of leachate analysis for metals and general chemistry are presented in Tables 4.9 and 4.10 respectively. In these tables, the objective column represents the Halton Region Bylaw 192-89 parameters which are the limits for leachate discharge to the sanitary sewer system.

All parameters are below their respective objectives except total dissolved solids (TSS), which in April was detected at 352 mg/L, thereby just exceeding the Halton Regional objective of 350 mg/L (see Table 4.10). This result may be considered anomalous as it is five times greater than the three previous results of 57 mg/L, 76 mg/L, and 41 mg/L reported in October 1992, April 1993, and October 1993, respectively. Future analyses will determine the validity of the April 1994 result as representative of MH15 leachate. An elevated concentration of copper (18.9 mg/L) found in October 1993 was believed and proven to be anomalous as the April 1994 copper result of 1.52 mg/L is more indicative of, but still slightly elevated over historical results. Apart from the anomalous elevated TSS value, the levels detected are consistent with that generally found in a closed municipal landfill leachate.

4.3.2 Priority Pollutants - Leachate

A summary of the 1994 detected priority pollutant parameters in the collection system (MH15) is outlined in Table 4.11. Historical and present data is incorporated in the data base found in Appendix G.

Only four of the priority pollutants included in the list for analysis were detected during the 1994 Monitoring Program. These detected parameters were VOC compounds: chlorobenzene, 1,4-dichlorobenzene; and Pesticides: carbaryl and endrin. No PCBs were detected within the leachate.

In April 1994, chlorobenzene was reported at a concentration of 22 µg/L, 1,4-dichlorobenzene at 3.6 µg/L, carbaryl at 13 µg/L, and endrin at 0.005 µg/L. None of these exceed comparative MOEE Drinking Water Objectives. Carbaryl and endrin have not historically been detected within the analyzed leachate samples.

Historically, the leachate quality has been characterized by sporadic relatively low concentrations of volatile organic compounds.

4.4 OFF-SITE GROUNDWATER MONITORING

4.4.1 Introduction

The off-Site groundwater monitoring program was designed to assess the presence of contamination of groundwater downgradient of the Bayview Park Landfill. It is recognized that the Site is old and at present has relatively weak leachate. Previous monitoring programs utilized organic nitrogen as an indicator of groundwater contamination. Results of these investigations show that organic nitrogen was not a useful indicator for illustrating a relationship between organic nitrogen levels in the overburden and the bedrock, nor between background and downgradient locations (CRA, 1988). The 1988 monitoring program concluded that bacteriological parameters were not a useful indicator of groundwater contamination (CRA, 1989). It was also observed that the location of well screens in the downgradient monitors had not been demonstrated to be placed within the active groundwater flow zones originating from the landfill. The 1994 Monitoring Program was modelled after the 1990 to 1993 Monitoring Programs, and designed to obtain representative groundwater from the shallow flow system and continue

widespread sampling of the shallow or active groundwater flow zone (CRA, 1990).

Pumping wells PW1 and PW3 were pumped and sampled on two sampling occasions to ascertain the 'average' groundwater quality downgradient of the Site. PW1 is located approximately 600 m downgradient of the Site, along the North Service Road. This well is completed in the Queenston Shale at a depth of 31.37 m below top of casing (bTOC) within the deep bedrock flow system. PW3 is located between PW1 and the Site boundary, approximately 160 m downgradient of the Site. PW3 is located in the Queenston Shale but within the shallow groundwater flow system. Each well was pumped for 5 hours prior to sampling. The samples were analyzed for general chemistry parameters and VOCs.

In addition, the nest of the wells at HC7 (HC7-1, HC7-2), the uppermost two bedrock wells at HC4 (HC4-2 and HC4-4), and the two intermediate wells monitoring the bedrock and the till/bedrock contact at the HC9 nest (HC9-2 and HC9-3) were sampled in April and July 1994. Well HC4-3 (one of the three uppermost bedrock wells at HC4 sampled during previous years) was removed from the monitoring program in 1994 because the well was reported to have been buried and not possible to sample. The observation wells were monitored for the same suite of general chemistry parameters as the pumping wells. In July 1994 selected observation wells were also analyzed for VOC parameters.

Table 4.12 presents the details of those wells included in the 1994 monitoring program. The historical analytical data for all groundwater locations is presented in the data base found in Appendix G.

4.4.2 General Chemistry

General chemistry results for the 1994 monitoring of PW1 and PW3 are presented in Table 4.13. The results indicate that values of conductivity, chloride, ammonia and TKN were significantly higher in PW1

than in PW3. Alkalinity was also found to be higher in PW3 than in PW1. This is consistent with observations reported in the 1993 monitoring report.

Chloride concentrations in PW1 (1,014 to 2,604 µg/L) and PW3 (290 to 409 mg/L) exceed the MOEE Drinking Water Objectives (May 1984) of 250 mg/L.

The results for the general chemistry parameters measured at the off-Site observation wells are provided in Table 4.14. The results indicate that with the exception of chloride all parameters are within applicable MOEE Drinking Water Objectives. High concentrations of chloride and conductivity are observed at all monitoring locations and are interpreted to represent naturally poor groundwater quality.

The characteristically poor natural groundwater quality and relatively weak leachate quality does not allow for the quantification of leachate impact on groundwater quality.

4.4.3 VOCs in Groundwater

No VOCs were reported above the method detection limit in any of the observation wells or pumping wells during the 1994 Monitoring Program. This is consistent with 1993 results and represents a slight improvement in water quality since chlorobenzene and toluene were detected on occasion prior to 1993.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 CONCLUSIONS

Based on the available data it is concluded that:

1. No overland leachate seepage was observed at leachate seepage locations in 1994. Moist to wet soil conditions were as were noted at locations LS-1, LS-7 and LS-8, on at least one occasion during the 1994 inspection program.

2. The leachate elevations in the leachate wells do not show persistent change since the installation of the LCS.

3. Surface water quality has improved since 1986 at all sampling locations downgradient of the landfill, although a degradation of surface water quality has been generally noticed since 1992 at both background (upstream) and downstream locations. Ecoli counts at upstream locations strongly indicate an upstream source of these bacteria.

4. The landfill appears to be affecting surface water quality as a result of shallow impacted groundwater discharge with respect to increased chloride, TKN, and un-ionized ammonia concentrations at landfill vicinity surface water monitoring locations as compared with upstream and downstream surface water monitoring locations. It should be noted that un-ionized ammonia concentrations are below the Provincial Water Quality Objective of 20 µg/L, and no objectives are available for chloride or TKN.

5. Bacteria levels across the Site were detected above the Provincial Water Quality Objectives in July 1994 at both background and downstream locations. The bacteria levels showed a marked increase in July 1994 which is likely reflective of summer low flow conditions.

6. The characteristically poor natural groundwater quality and relatively weak leachate quality does not allow for the ready quantification of leachate impacts on groundwater quality.

7. The occurrences of volatile organics in the leachate and groundwater is generally seen to be sporadic and characterized by low or trace levels only.

8. Surface water monitoring locations SW3 and SW4 have been dry since the installation of the LCS indicating that the LCS is effective in controlling shallow groundwater and surface leachate seepage discharge.

5.2 RECOMMENDATIONS

Based on the above conclusions and pending the concurrence from the MOEE with respect to the findings of the Environmental Performance Report, the following recommendations are made:

1. In the interim, pending MOEE concurrence with the Environmental Performance Report, the 1995 Monitoring Program will be continued as was outlined for the 1994 Monitoring Program contained in Appendix D of this report.

2. The monitoring specifications for the Site will be revised to reflect the rationalized monitoring program as presented within the Environmental Performance Report upon concurrence from and/or acceptance by the MOEE.

TABLE 2.1

HAMILTON REGION PRECIPITATION DATA FOR 1994
1994 MONITORING PROGRAM
BAYVIEW PARK LANDFILL SITE

Month	*Total 1994 Precipitation (1) (mm)*	*Annual Average Precipitation (2) (mm)*
January	83.8	61.3
February	45.7	53.5
March	57.7	73.7
April	102.2	74.3
May	108.6	70.7
June	67.8	78.4
July	98.0	81.0
August	67.6	84.7
September	36.1	83.5
October	28.0	66.3
November	91.3	80.2
December	65.4	82.8
Total	852.2	890.4

Notes:

(1) Precipitation data from the Hamilton Airport as measured by the Hamilton Weather Office.

(2) Based on a 50-year average (1940-1990).

Escherichia Coli (per 100 mL)	100	NA	NA	NA
Number of Samples Taken				

Notes:

All results are in mg/L unless specified otherwise.
(1) pH and Conductivity measured in the field in 1987 to 1993, and in the laboratory during 1986
(2) Samples collected in March and May 1987
(3) Surface water sampling location SW2 does not exist after 1987 as a result of installation of the Collection System
(4) Surface water location SW1 was dry in July 1989, August 1990, July 1991, July 1993 and October 1993.
(5) Surface water location SW3 was dry throughout 1987-1994 sampling periods
(6) Provincial Water Quality Objectives and Guidelines (PWQO/G), MOEE (July 1994).
(7) Guideline no longer in place but used as a benchmark for long-term monitoring, PWQO/G, MOEE (July 1994).
(8) Surface water location SW4 was dry throughout 1987-1994 sampling periods.
(9) Un-ionized ammonia = (Ammonia concentration) x (correction factor). Correction factors (a function of temperature and pH) obtained from Provincial Water Quality Objectives and Guidelines, MOEE (July 1994)
J - The associated numerical value is an estimated quantity
NA - Not analyzed
< - Less than Method Detection Limit
[ ] - Concentration exceeds associated objective

Notes:

All results are mg/L unless specified otherwise.

(1) pH and Conductivity measured in the field in 1987 to 1993, and in the laboratory during 1986.
(2) Sample location SW10 was dry in July 1989, August 1990, July 1991.
(3) Provincial Water Quality Objectives and Guidelines (PWQO/G), MOEE (July 1994).
(4) Guideline no longer in place but used as a benchmark for long-term monitoring, PWQO/G, MOEE (July 1994).
(5) Un-ionized ammonia = (Ammonia concentration) x (correction factor). Correction factors (a function of temperature and pH) obtained from Provincial Water Quality Objectives and Guidelines, MOEE (July 1994).

NA - Not analyzed
< - Less than Method Detection Limit
[ ] - Concentration exceeds associated objective

APPENDIX A

CERTIFICATE OF APPROVAL

NOTICE

OF THE ENVIRONMENT

JUL 17 1986

CENTRAL REGION
OAKVILLE OFFICE

TO: The Corporation of the
City of Burlington
P.O. Box 5013
426 Brant Street
Burlington, Ontario L7R 3Z6

ATTENTION: MS. HELEN MACRAE, CLERK

Take Notice that condition no. 1 of Provisional Certificate of Approval No. A 210103, dated October 11, 1973, is hereby revoked and replaced with the following conditions:

1. Prior to the excavation of any waste in connection with the construction of a leachate collection system approved under Certificate of Approval No. 3-0819-86-007, the City shall file with the Director of Central Region of the Ministry of the Environment (the Regional Director) plans and design details for the relocating and covering of the excavated waste and the recontouring of the site. No waste may be excavated or relocated without the approval of the Regional Director and except in accordance with such plans and design details.

2. All excavated waste shall be handled in accordance with the "Health and Safety Protocol" described in a letter from Greg Ferraro, P. Eng. of Conestoga-Rovers & Associates Limited, to Lyle Parsons of the Ministry dated July 14, 1986.

3. Surface improvements shall be completed in accordance with Section 8.0 of the "Detailed Design Report, Leachate Collection System and Surface Drainage Improvements" dated June 1986 and the "Contract Documents for Surface Drainage Improvements" and associated Plans 1 to 4 issued June 20, 1986.

4. The City shall carry out the monitoring and inspection program as approved by the Regional Director with such modifications as may be approved from time to time by the Regional Director. On or before March 1st of each year, the City shall file a report with the Regional Director containing an analysis and evaluation of the monitoring and inspection program for the previous year.

The reasons for the imposition of these conditions are as follows:

1. The reason for condition 1 is to ensure that the relocation of the waste is carried out in accordance with a defined protocol. Not doing so may create a nuisance and would not be in the public interest.

2. The reason for condition 2 is to protect the health and safety of persons involved in the relocation of the waste.

3. The reason for condition 3 is to reduce infiltration of surface water into the site, to eliminate exposed refuse which is creating a nuisance and to ensure proper control of the site.

4. The reason for condition 4 is to provide for the investigation of groundwater contamination in the area of the site and to ensure that the existing surface water contamination problem is abated by the installation of the leachate collection system.

You may by written notice served upon me and the Environmental Appeal Board within 15 days after receipt of this Notice, require a hearing by the Board.

This Notice should be served upon:

The Secretary
Environmental Appeal Board

Certificate of Approval (Sewage)
Certificat d'autorisation (eaux usées)

Number / *Numéro* 3-0819-86-007

Whereas / ***Attendu que***

THE CORPORATION OF THE CITY OF BURLINGTON

of / d'

has applied in accordance with Section 24 of the Ontario Water Resources Act for approval of:
a fait, conformément à l'article 24 de la loi sur les ressources en eau de l'Ontario, une demande d'autorisation:

A new leachate collection, pumping and transmission system to collect and dispose of (into the City of Burlington's municipal sanitary sewer system) surface leachate and contaminated shallow groundwater from the closed Bayview Park sanitay landfill site bounded by King Road to the northeast and the upper reaches of Indian Creek to the southwest in the City of Burlington, consisting of a toe drain system located at the base of a ravine to the west of the landfill area running approximately 250 metres north of the landfill south property line, two pre-fabricated leachate collection sumps having twin (one duty and 1 standby), 1.5 and 2.0 kW explosion proof submersible type pumps, each pump being rated at:

Pump	Rated Head (m)	Rated Capacity (L/min)
2	17.4	225
3	19.9	200

together with all associated pump level controls, access hatch, electrical control panel internal sump piping, fittings and appurtenances as well as a 200 mm buried perforated PVC leachate collector header at each sump location and 50-75 mm diameter high density polyethylene collected leachate forcemains located along the south edge of the landfill fill area discharging to a 200 mm diameter leachate collection sewer and forcemain, the forcemain section of the sewer being located within the fill area of the landfill (southern edge) for a distance of 120 metres to a height of land with the gravity section of the leachate collection sewer continuing along the south side of the landfill to King Road a distance of 470 m. The sewer then turns south following the west ditch of King Road down to the North Service Road, a distance of approximately 590 metres. The gravity sewer then changes diameter to 450 mm and crosses under the North Service Road and Highway 403 at a point 20 m west of the King Road Overpass. The sewer crosses Highway 403 (a distance of 80 m) and then continues south for 127 metres on the west side of King Road to an existing 450 mm municipal sanitary sewer located on King Road, all in accordance with the documents listed in Schedule "A" (attached) at a total estimated cost, including engineering and contingencies, of EIGHT HUNDRED AND FIFTY THOUSAND DOLLARS ($850,000.00), subject to the following special terms and conditions considered necessary by the undersigned:

....2

Now therefore this is to certify that after due enquiry the said proposed works have been approved under Section 24 of the Ontario Water Resources Act.

Le présent document certifie qu'après vérification en bonne et due forme la construction dudit projet d'ouvrages a été approuvée aux termes de l'article 24 de la loi sur les ressources en eau de l'Ontario.

This Certificate supercedes Certificate of Approval No. 3-0819-86-006 issued at Toronto, on June 27, 1986.

has applied in accordance with Section 24 of the Ontario Water Resources Act for approval of:
a fait, conformément à l'article 24 de la loi sur les ressources en eau de l'Ontario, une demande d'autorisation:

SPECIAL TERMS AND CONDITIONS

1. Upon completion of the sewage works the Corporation of the City of Burlington shall supply the Ministry of the Environment, Environmental Approvals and Land Use Planning Branch with as-constructed drawings for the on-site works namely those works between Manhole No. 12 and Manhole No. 21, including all works located within the Bayview Park Landfill site boundary as shown on the engineering drawing entitled Bayview Park Landfill Leachate Collection System, General Layout, Drawing No. 06, Sheet 1 of 15, prepared by Conestoga-Rovers & Associates Limited dated April, 1986 revised as per addendum No. 1 and Change Order No. 1.

2. All liquids which require dewatering for any reason during construction of all on-site works between Manhole No. 12 and Manhole No. 21 as described in Condition No. 1 shall be discharged to a sanitary sewer. Written records of volumes of liquids dewatered shall be supplied to the MOE inspector upon request.

Now therefore this is to certify that after due enquiry the said proposed works have been approved under Section 24 of the Ontario Water Resources Act.

ONTARIO MINISTRY
OF THE ENVIRONMENT

JUL 17 1986

CENTRAL REGION
OAKVILLE OFFICE

Ministry of the Environment

Ontario

NOTICE

TO: The Corporation of the City of Burlington
Box 5013
426 Brant Street
Burlington, Ontario
L7R 3Z6

You are hereby notified that a Conditional Certificate of Approval No. 3-0819-86-007 has been issued to you subject to the conditions outlined therein.

The reasons for the imposition of these conditions are as follows:

1. The filing of as-constructed drawings with the Ministry of the Environment, Environmental Approvals and Land Use Planning Branch is necessary to show that the sewage works were built in conformity with the approved documents listed as Schedule "A" in Certificate of Approval No. 3-0819-86-007 if any questions arise as to what was actually constructed.

2. Liquids from this site contain contaminants which may impair the quality of water in Indian Creek if discharged, contrary to Section 16 of the Act.

You may by written notice served upon me and the Environmental Appeal Board within 15 days after receipt of this Notice, require a hearing by the Board.

This Notice should be served upon:

The Secretary,
Environmental Appeal Board,
1 St. Clair Ave. West,
5th Floor,
Toronto, Ontario.
M4V 1K7

AND

The Director,
Section, 24, OWR Act,
Ministry of the Environment,
135 St. Clair Ave. West,
Toronto, Ontario.
M4V 1P5.

DATED at Toronto this 16th day of July , 19 86 .

Director,
Section,
Ministry of the Environment.

1771 (09/84)

SCHEDULE "A"

This Schedule "A" forms part of Certificate of Approval No. 3-0819-86-007 issued on July 16, 1986.

1. Detailed design drawings prepared by Conestoga-Rovers and Associates Limited, Consulting Engineers, issued June 23, 1986 and date stamped July 8, 1986 Environmental Approvals and Land Use Planning Branch entitled Bayview Park Landfill, Leachate Collection System, Contract No. 86-16.

2. Contract Specifications dated June, 1986 entitled City of Burlington, Bayview Landfill Site Leachate Collection System and Surface Drainage Improvements, Contract 86-16, File 760.04-2 (noted by MOE as a second submission).

3. A letter dated June 17, 1986 to Mr. Lyle Parsons from Greg Ferraro, P.Eng. entitled Addendum No. 1, Bayview Park Landfill, Leachate Collection System detailing changes to the Leachate Collection System, Contract 86-16.

4. A letter dated June 23, 1986 to Lyle Parsons, B.E.S. Systems Co-ordinator from Alan Ramsay, Environmental Management Co-ordinator, The Corporation of the City of Burlington, with attached Addendum No. 2, Bayview Park Landfill, Leachate Collection System detailing changes to the leachate pumping system, Contract 86-16.

5. Change Order No. 1 dated June 25, 1986 entitled Corporation of City of Burlington, Bayview Park Landfill, Leachate Collection System Contract 86-16, unsigned.

6. A letter dated June 26, 1986 to Mr. Lyle F. Parsons, B.E.S. Systems Co-ordinator from Greg Ferraro, P.Eng., entitled Change Order No. 1, City of Burlington, Bayview Park Landfill Leachate Collection Systems with attached Appendix A entitled PVC and HDPE Pipe Strength Calculations.

7. A letter dated July 4, 1986 to Mr. T. Armstrong, Acting Director Environmental Approvals and Land Use Planning Branch from Michael N. Boggs, Chief Administrative Officer entitled Bayview Park Landfill Site, Ontario Water Resources Act Application.

Mr. Peter Hayes, B. Sc.
Conestoga-Rovers & Associates Limited
651 Colby Drive
Waterloo, Ontario
N2V 1C2

Dear Mr. Hayes:

Re: 1993 Bayview Park Landfill Site Monitoring Report
Conestoga Rowers & Associates, March 1994.

We reviewed the above report and offer the following comments:

A. Ground Water

1). The Bayview Park Landfill Site is underlain by shale bedrock, ground water is complex and largely controlled by the extent, geometry and fractures in the shale. Shallow ground water flow is predominantly lateral within the weathered and fractured upper shale. Ground water is to the surrounding surface water bodies. Within the deeper, less permeable section of the shale, ground water is characterized by pronounced downward gradients and highly mineralized waters.

2). Concurrent with be present assessment of all existing chemical and hydrogeological data, an environmental performance report is now under preparation. The objective of this report is to provide for an up to date environmental impact evaluation and rationalized monitoring program for the closed site. The results will allow for determining appropriate buffer, monitoring and contingency requirements with the respect to the proposed adjacent land use development.

0761-OFA (10/93)

100% Unbleached Post-Consumer Stock

3). Based on water quality monitoring results to date it has been difficult to assess the exact extent of leachate contaminated ground water. This is because of the naturally occurring highly mineralized water and the difficulty in finding a suitable landfill related indicator parameter. Trace levels of volatile organics have occasionally been detected but results are inconsistent.

4). We concur with the overall conclusions in the report. The proposed 1994 monitoring program as outlined in Appendix C in the report should continue for this year.After the Environmental Performance evaluation report is completed, the monitoring programme would require to be redesigned, taking into account the extent of buffer, contingency requirements and the prosed adjacent land use development

B. Surface Water

1). From the data provided, it appears that the leachate collection system put in place in 1986 does result in reduced impact on surface water. However, page 22 of the report indicates that the surface water locations SW3 and SW4 are dry due to the performance of the leachate collection system. It also indicates that these locations were moved downstream in 1987. Because the dryness could also be due the new locations, we suggest these locations be moved even further downstream so that samples may be collected to ensure that the leachate collection system is working.

2). The data presented in Appendix F (Section F-1) indicates an historical occurrence of toluene and iron in water. These parameters are not analyzed in the more recent sampling rounds. We suggest that these parameters (and others that may be characteristic of the leachate, including PCBs if found) be incorporated into the sampling rounds so that any changes in landfill impacts can be gauged.

3). As far as sampling trends are concerned, the report indicates an increase in TKN and coliform at SW10 (page 24), an increase in TKN at SW6 (page 25), an increase in unionized ammonia, TKN and coliform at SW7 (page 26), an increase in TKN and ammonia at SW8 (page 26), and an increase in TKN and ammonia at SW13 (page 27). Would you please provide explanation or hypotheses for these trends.

4). The above comments should be incorporated into ongoing monitoring program.

If you need clarification on the above, please call me at (905)815-5931.

Yours truly,

T. Brankovic, P. Eng.,
District Engineer
Halton-Peel Region

Reference No. 1354

Mr. Tom Brankovic
Ministry of Environment and Energy
Halton-Peel District Office
1235 Trafalgar Road, Suite 401
Oakville, Ontario
L6H 3P1

Dear Mr. Brankovic:

Re: Response to MOEE Comments
1993 Bayview Park Landfill Site Monitoring Report

Comments prepared by the MOEE regarding the above-noted report are outlined in a letter to Mr. Peter Hayes dated February 21, 1995. This letter serves to provide CRA's response to the comments made by the MOEE. They are addressed below on a point-by-point basis:

A. GROUNDWATER

MOEE Comment:

A-1) The Bayview Park Landfill Site is underlain by shale bedrock, groundwater is complex and largely controlled by the extent, geometry and fractures in the shale. Shallow groundwater flow is predominantly lateral within the weathered and fractured upper shale. Groundwater is to the surrounding surface water bodies. Within the deeper, less permeable section of the shale, groundwater is characterized by pronounced downward gradients and highly mineralized waters.

CRA Response:

A-1) CRA agrees with the intent of this statement.

MOEE Comment:

A-2) Concurrent with the present assessment of all existing chemical and hydrogeological data, an environmental performance report is now under preparation. The objective of this report is to provide for an up-to-date environmental impact evaluation and rationalized monitoring program for the closed Site. The results will allow for determining appropriate buffer,

monitoring and contingency requirements, with respect to the proposed adjacent land use development.

CRA Response:

A-2) CRA agrees with this statement. The referenced report is entitled "Environmental Performance Report, Bayview Park Landfill, Burlington, Ontario" and was submitted to Mr. J. Budz of the MOEE, Central Region on November 4, 1994. Complete MOEE Comments with respect to this report are pending.

MOEE Comment:

A-3) Based on water quality monitoring results to date it has been difficult to assess the exact extent of leachate contaminated groundwater. This is because of the naturally occurring highly mineralized water and the difficulty in finding a suitable landfill related indicator parameter. Trace levels of volatile organic have occasionally been detected but results are inconsistent.

CRA Response:

A-3) CRA concurs with this statement.

MOEE Comment:

A-4) We concur with the overall conclusions in the report. The proposed 1994 monitoring program as outlined in Appendix C in the report should continue for this year. After the Environmental Performance evaluation report is completed, the monitoring program would require to be redesigned, taking into account the extent of buffer, contingency requirements and the proposed adjacent land use development.

CRA Response:

A-4) CRA agrees with this statement. Two items are however noted for clarification between the monitoring program outlined in Appendix C of the 1993 Monitoring Report and the program carried out in 1994.

Firstly, surface water locations SW9A-93, SW13-93, SW14-93 and SW15-93 which were included in the 1993 Monitoring Specifications were not included in the 1994 Monitoring Specifications as these are new surface water monitoring locations proposed as part of the rationalized monitoring program included in the Environmental Performance Report, and have not been included in historical monitoring.

Secondly, monitoring of gas levels in GP1-93, GP2-93 and GP4-93 which are included in the 1993 Monitoring Specifications are not included in the 1994 Monitoring Specifications as these items are also included as part of the proposed rationized monitoring program, and have not been included as part of historical monitoring. It should be noted that GP4-93 should read GP3-93.

The reason for these two inclusions in 1993 monitoring program, namely the additional surface water locations and the gas probe monitoring, was to collect that data from these monitoring locations by CRA field personnel for specific use in the Environmental Performance Report. Once MOEE concurrence is received, the monitoring program will be revised to reflect that which is presented in the Environmental Performance Report.

B. SURFACE WATER

MOEE Comment:

B-1) *From the data provided, it appears that the leachate collection system put in place in 1986 does result in reduced impact on surface water. However, page 22 of the report indicates that the surface water location SW3 and SW4 are dry due to the performance of the leachate collection system. It also indicates that these locations were moved downstream in 1987. Because the dryness could also be due to the new locations, we suggest these locations be moved even further downstream so that samples may be collected to ensure that the leachate collection system is working.*

CRA Response:

B-1) The purpose of the installation of the leachate collection system was to control the overland leachate seepage and as a consequence mitigate landfill derived impacts on the adjacent Indian Creek and its' tributaries. The continued observations that SW3 and SW4 are essentially dry and the absence

of leachate seepage, indicate that the Leachate Collection System is operating effectively in this area, in keeping with the stated objectives of the system.

MOEE Comment:

B-2) *The data presented in Appendix F (Section F-1) indicates an historical occurrence of toluene and iron in water. These parameters are not analyzed in the more recent sampling rounds. We suggest that these parameters (and others that may be characteristic of the leachate, including PCBs if found) be incorporated into the sampling rounds so that any changes in landfill impacts can be gauged.*

CRA Response:

B-2) These parameters were monitoring in the surface water as part of the 1986 monitoring program at the Site. Contained within Section 6.1, Proposed 1987 Surface Water Monitoring of the CRA report entitled "Updated 1986 Monitoring Report, Bayview Landfill Site, City of Burlington" submitted to the City of Burlington and the MOE on March 12, 1987 is a statement regarding the analysis of priority pollutants within surface water. The report reads as follows:

"Some VOC analysis remains in the 1987 program because VOCs have been identified as migrating in the fractured bedrock aquifer. In addition, because of this mobility, VOCs are a useful check. Synthetically derived base/neutral and acid extractable species, for organic contaminants and PCB/pesticides have not been identified in the water column and therefore, are no longer regarded as necessary. In the event that VOCs increase substantially, the need for other priority pollutant analyses will be reevaluated."

In addition, the monitoring of metals, base/neutral and acid extractables, VOCs and Pesticides/PCBs continues to occur for leachate from the landfill. The results of this leachate monitoring provide a basis for determining whether or not these parameters present a potential concern within surface water at the Site.

MOEE Comment:

B-3) As far as sampling trends are concerned, the report indicates an increase in TKN and coliform at SW10 (page 24), an increase in TKN at SW6 (page 25), an increase in unionized ammonia, TKN and coliform at SW7 (page 26), an increase in TKN and ammonia at SW8 (page 26), and an increase in TKN and ammonia at SW13 (page 27). Would you please provide explanation or hypotheses for these trends.

CRA Response:

B-3) As stated on pages 27 and 28 and as indicated on Table 4.7 and 4.8 in the 1993 Progress Report an upstream source of total or fecal coliforms is indicated as landfill vicinity concentrations are less than upstream and downstream levels. Upstream TKN concentrations have also generally increased for this time period suggesting an upstream surface water/shallow groundwater source of this compound. As stated in the June 1981 MOE document "Outlines of Analytical Methods", sewage and industrial waste treatment effluents and runoff from agricultural areas where fertilizers have been used are the primary sources of TKN besides natural nitrogen fixation and anaerobic nitrate reduction processes.

The landfill does appear to be affecting surface water quality as a result of shallow impacted groundwater discharge with respect to increased chloride, ammonia (including unionized ammonia) concentrations at landfill vicinity surface water monitoring locations as compared with upstream and downstream monitoring points. Unionized ammonia concentrations are below the respective Provincial Water Quality Objective of 20 µg/L.

MOEE Comment:

B-4) The above comments should be incorporated into ongoing monitoring program.

CRA Response:

B-4) The above responses by CRA, where appropriate, have been incorporated into the 1994 Monitoring Report.

March 1, 1995 Reference No. 1354-30

If you have any questions or concerns regarding the above, please do not hesitate to contact us.

1994 MONITORING PROGRAM

CONESTOGA-ROVERS & ASSOCIATES
1994 SITE MONITORING SPECIFICATIONS

PROJECT: Bayview Park Landfill Site

PROJECT NO.: 1354-30

PROJECT MANAGER: Greg Ferraro

PROJECT COORDINATOR: Peter Hayes

MONITORING STAFF:

	RESPONSIBILITY
Roger Waller	Field Technician
John Duda	Field Technician
Rob Toth	Coordinator/Chemist QA/QC

LABORATORY USED: CAS, Novamann (Ontario) Ltd. (Mann)

AUTHORIZATION:

MONITORING EVENT	SIGNATURE	DATE
April		
July		
October		Oct 19/94

MONITORING PROGRAM DESCRIPTION
- surface water monitoring Section 1.0
- leachate level monitoring Section 2.0
- leachate collection monitoring Section 3.0
- off-Site groundwater monitoring Section 4.0
- leachate seep inspection Section 5.0

SPECIAL INSTRUCTION
- January event: water levels only
- April event:
- July event:
- **October event:**

REVISION:

DATE	REVISION
March 2, 1994	review April '94 for monitoring event
June 2, 1994	review July '94 for monitoring event
June 13, 1994	HC4-3, HC6-2 and HC6-3 were destroyed since April 10, 1991. Add Escherichia Coli (E. Coli) coliform bacteria to SW analytical test.
Sep.9, 1994	review Oct'94 for monitoring event

1.0 SURFACE WATER MONITORING

1.1 Locations: 12 surface water: SW1-87, SW3-87, SW4-87, SW5-87, SW6-87, SW7-87, SW8-87, SW9-87, SW10-87, SW11-87, SW12-87, SW13-88

sample locations	12
duplicates	1
field Blank	1
Total	14

(additional trip blank for VOCs)

1.2 Monitoring Frequency:

Semiannually: April, after significant rainfall (wet weather sampling) July (dry weather sampling), if July sampling event is dry then surface water samples will be collected in October

1.3 Types of Monitoring

1. measure flow rate accurately at each location using flow meter and record as L/sec or gpm

2. sampling:

VOCs	see Table A.1
General Chemistry	field pH, field conductivity, alkalinity, chloride, sulfate, TKN, ammonia-N, phenols
Bacteria	total coliforms, fecal coliforms, fecal streptococci, E. Coli coliforms

3. laboratory detection limit for ammonia must be less than 0.02mg/l

2.0 LEACHATE WELL MONITORING

2.1 Location: 6 Leachate Wells LW1, LW2, LW3, LW4, LW5, LW6

2.2 Monitoring Frequency:

Twice per year: April and July

2.3 Types of Monitoring

1. measure depth with plopper (sound) of each leachate well
2. monitor leachate level in each well

3.0 LEACHATE COLLECTION SYSTEM MONITORING

3.1 Location: 2 Manholes MH15 and MH14

Sample location	1 (MH15 only)
Field blank	1

(additional trip blank for VOCs in October only)

3.2 Monitoring Frequency:

Two times per year for leachate quality at MH15: April and October

3.3 Types of Monitoring

1. Sampling (at MH15):

General chemistry	see Table A.1, includes Field pH and Field Conductivity
Metals & Cyanide	see Table A.1
VOCs	see Table A.1
BNAEs	see Table A.1
Pesticides & PCBs	see Table A.1

NOTE: Attached parameter list (Table A.1) must be followed with no emissions.

4.0 OFF-SITE GROUNDWATER MONITORING

4.1 APRIL - WET WEATHER MONITORING EVENT

4.1.1 Locations:

11 Groundwater	PW1, PW3, HC4-2, HC4-3, HC4-4, HC6-2, HC6-3, HC7-1, HC7-2 HC9-2, HC9-3

General chemistry	
Sample locations	11
Duplicates	2 (one each of PW series and HC series)
Field Blank	1
Total	14
VOCs	
Sample locations	2 (PW1, PW3)
Duplicate	1
Total	3

4.1.2 Monitoring Frequency:

APRIL, after significant rainfall

4.1.3 Types of Monitoring

1. measure well depth and water level at each well

2. pump PW1 and PW3 for a minimum of 5 (five) hours (keck pump or well wizard purge pump may be used)

- sample PW1 and PW3, after pumping

3.	Sampling:	General Chemistry	field pH, field conductivity, alkalinity, TKN, ammonia-N, chloride
			phenol
		VOCs	see Table A.1 for VOC analyses

4.2 JULY - DRY WEATHER MONITORING EVENT

4.2.1 Locations:

11 Groundwater	PW1, PW3, HC4-2, HC4-4, HC7-1, HC7-2, HC9-2, HC9-3

General chemistry	
Sample locations	8
Duplicates	2 (one each of PW series and HC series)
Field Blank	1
Total	11

VOCs	
Sample locations	6 (2 PW series and 4 HC series wells)
Duplicate	2 (one each of PW series and HC series)
Field Blank	1
Total	9

4.2.2 Monitoring Frequency:

JULY, after significant dry period

4.2.3 Types of Monitoring

1. measure well depth and water level at each well

2. pump PW1 and PW3 for a minimum of 5 (five) hours (Keck pump or Well Wizard purge pump may be used)
   - sample PW1 and PW3 after pumping for VOCs and general chemistry

3. sample select HC series for VOCs, one well at each HC nest, wells to be sampled will be verified by Peter H. prior to monitoring event

4.	Sampling:	General Chemistry	field pH, field conductivity, alkalinity, TKN, ammonia-N, chloride
			phenol
		VOCs	see Table A.1 for VOC analyses

5.0 LEACHATE SEEP INSPECTION

5.1	Locations:	9 Leachate Seeps	LS1, LS2, LS3, LS4, LS5, LS6, LS7, LS8, LS9

5.2 Monitoring Frequency:

Four times per year: January, April, July and October

5.3 Types of Monitoring:

1. Identify and photograph any leachate seep that has re-occured
2. Estimate flow rate at the seep and report as L/sec or gpm
3. Complete leachate seep inspection sheets
4. Report any occurrences of leachate seeps immediately to Greg Ferraro or Peter Hayes.

6.0 BOTTLE REQUIREMENTS

Analytical Destination	Samples Analyzed	Test Parameters
a) April		
CAS	30 X 1000 mL	General Chemistry
	30 x 500 ml	Phenols
Mann	15 x bacteria kits	Bacteria
Mann	20 x 2 x 40 ml (+ 2 trip blanks)	VOCs
	2 x 500 ml	metals
	2 x 250 ml	mercury
	2 x 250 ml	cyanide
	2 x 1000 ml	BNAEs
	2 x 1000 ml	Pesticides & PCBs
b) July		
CAS	30 X 1000 mL	General Chemistry
	30 x 500 ml	Phenols
Mann	15 x bacteria kits	Bacteria
Mann	25 x 2 x 40 ml (+ 2 trip blanks)	VOCs
c) October		
CAS	2 x 1000 ml	General Chemistry
	2 x 500 ml	Phenols
Mann	3 x 2 x 40 ml	VOCs
	2 x 500 ml	metals
	2 x 250 ml	mercury
	2 x 250 ml	cyanide
	2 x 1000 ml	BNAEs
	2 x 1000 ml	Pesticides & PCBs

TABLE A.1
LEACHATE PARAMETER LIST
1994 MONITORING PROGRAM
BAYVIEW LANDFILL SITE

GENERAL CHEMISTRY (CAS)

Hardness	Alkalinity	Fluoride
Chloride	Sulfate	Phosphorous (total)
TKN	Ammonia-N	Phenols
BOD	COD	Suspended Solids

METALS & CYANIDE (Mann)

Aluminum (total)	Antimony (total)	Arsenic (total)
Barium (total)	Bismuth (total)	Cadmium (total)
Chromium (total)	Cobalt (total)	Copper (total)
Iron (total)	Lead (total)	Manganese (total)
Mercury (total)	Molybdenum (total)	Nickel (total)
Selenium (total)	Silver (total)	Tin (total)
Titanium (total)	Vanadium (total)	Zinc (total)
Cyanide (total)		

VOCs (Mann)

1,1-Dichloroethane	1,2-Dichloroethane	1,1,1-Trichloroethane
Benzene	Trichloroethylene	Toluene
Tetrachloroethylene	Ethylbenzene	Chlorobenzene
1,3-Dichlorobenzene	1,4-Dichlorobenzene	m + p-Xylene
o-Xylene		

BNAEs (Mann)

bis(2-ethylhexyl)Phthalate

PESTICIDES & PCBs (Mann)

Aldrin	Carbaryl	Chlordane (Alpha and Gamma)
DDT	Diazinon	Dieldrin
Endrin	Heptachlor	Heptachlor Epoxide
Lindane (Gamma BHC)	Methoxychlor	Methyl Parathion
Parathion (Ethyl Parathion)	Toxaphene	PCBs

FROM OPS

MAR - 9 1994

Dear Mr. Skora:

Re: Bayview Park Landfill Site
Leachate Discharge Fees
Regional Sanitary System
File: 760-04-1

as per conversation E. Verticchio Feb 16/95 CLS

During the period of January ~~11~~ 22, 1994 to March 3, 1994 inclusive the leachate discharge flow from the closed Bayview Landfill Site top the Regional Sanitary Sewer were as follows:

Location	Pump	Pump Hours	Rate (M3 Hr.)	Total Flow
Station 2	1	82.9	12.560	1,041.22
Station 2	2	95.4	12.560	~~1,195.71~~ 1198.22
Station 3	1	308.7	8.025	2,477.32
Station 3	2	337.1	8.025	2,705.23
Colleciton (M.H. 14)		-	-	17.63
TOTAL				~~7,437.11~~ 7439.62

Estimates of flow volumes for the collector located at manhole 14 are based upon an average daily flow of 0.43 cubic metres.

Please direct all invoicing for discharge fees and correspondence to my attention.

Yours truly,

E. Verticchio,
Manager of Contract and
Client Services

LEACHATE SEEP INSPECTION

LEACHATE SEEP 3

- condition of soil patch Dry
- discharge observed yes _____ no ✓
  if yes, estimated flow _____ size of discharge point _____
- odour/gas emission yes _____ no ✓
  if yes, describe _____
- change from previous inspection yes _____ no ✓
  if yes, describe _____
- photograph taken yes _____ no ✓
- action required yes _____ no ✓

LEACHATE SEEP 4

- condition of soil patch Dry
- discharge observed yes _____ no ✓
  if yes, estimated flow _____ size of discharge point _____
- odour/gas emission yes _____ no ✓
  if yes, describe _____
- change from previous inspection yes _____ no ✓
  if yes, describe _____
- photograph taken yes _____ no ✓
- action required yes _____ no ✓

CONESTOGA-ROVERS AND ASSOCIATES LIMITED
LEACHATE SEEP INSPECTION

LEACHATE SEEP 5

- condition of soil patch Dry
- discharge observed yes _____ no ✓
  if yes, estimated flow _____ size of discharge point _____
- odour/gas emission yes _____ no ✓
  if yes, describe _____
- change from previous inspection yes _____ no ✓
  if yes, describe _____
- photograph taken yes _____ no ✓
- action required yes _____ no ✓

LEACHATE SEEP 6

- condition of soil patch Dry
- discharge observed yes _____ no ✓
  if yes, estimated flow _____ size of discharge point _____
- odour/gas emission yes _____ no ✓
  if yes, describe _____
- change from previous inspection yes _____ no ✓
  if yes, describe _____
- photograph taken yes _____ no ✓
- action required yes _____ no ✓

CONESTOGA-ROVERS AND ASSOCIATES LIMITED
LEACHATE SEEP INSPECTION

LEACHATE SEEP 7

- condition of soil patch Dry
- discharge observed yes _____ no ✓
  if yes, estimated flow _____ size of discharge point _____
- odour/gas emission yes _____ no ✓
  if yes, describe _____
- change from previous inspection yes ✓ no _____
  if yes, describe Patch was moist last ev
- photograph taken yes _____ no _____
- action required yes _____ no _____

LEACHATE SEEP 8

- condition of soil patch Dry
- discharge observed yes _____ no ✓
  if yes, estimated flow _____ size of discharge point _____
- odour/gas emission yes _____ no ✓
  if yes, describe _____
- change from previous inspection yes ✓ no _____
  if yes, describe Patch was moist last ev
- photograph taken yes _____ no ✓
- action required yes _____ no ✓

CONESTOGA-ROVERS AND ASSOCIATES LIMITED
LEACHATE SEEP INSPECTION

LEACHATE SEEP 9

- condition of soil patch Dry
- discharge observed yes _____ no ✓
  if yes, estimated flow _____ size of discharge point _____
- odour/gas emission yes _____ no ✓
  if yes, describe _____
- change from previous inspection yes _____ no ✓
  if yes, describe _____
- photograph taken yes _____ no ✓

LEGEND (MOE Obj.: Ontario Surface Water or Groundwater Objectives, revised July 1993)

J - The associated value is an estimated quantity.
U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.
-- - The parameter was not analyzed.
ND - The material was analyzed, but not detected above an unstated method detection limit.
TR - Trace level detection.
< - Indicates result less than that shown.
> - Indicates result greater than that shown.
R - The data was not useable.
NS - Insufficient sample.
p - Proposed MOE Surface Water Objective.
* - for PH >6.5 to 9.0
*** - a) Cadmium-0.15 ug/l (if hardness 0-100)
0.45 ug/l (if hardness >100)
b) Copper-1 ug/l (if hardness 0-20)
5 ug/l (if hardness >20)
c) Lead-1 ug/l (if hardness 0-30)
3 ug/l (if hardness 30-80)
5 ug/l (if hardness >80)
d) Beryllium- 11 ug/l (if hardness <75)
1100 ug/l (if hardness >75)
(a) - Indicates units were /50ml rather than that shown.
- for pH of 6.5 to 9.0

LEGEND (MOE Obj.: Ontario Surface Water or Groundwater Objectives, revised July 1993)

J	- The associated value is an estimated quantity.
U	- The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	- The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.
--	- The parameter was not analyzed.
ND	- The material was analyzed, but not detected above an unstated method detection limit.
TR	- Trace level detection.
<	- Indicates result less than that shown.
>	- Indicates result greater than that shown.
R	- The data was not useable.
NS	- Insufficient sample.
i	- Interim Maximum Acceptable Concentration (IMAC).
(a)	- Indicates units were /50ml rather than that shown.

LEGEND

J	- The associated value is an estimated quantity.
U	- The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	- The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.
--	- The parameter was not analyzed.
ND	- The material was analyzed, but not detected above an unstated method detection limit.
TR	- Trace level detection.
<	- Indicates result less than that shown.
>	- Indicates result greater than that shown.
R	- The data was not useable.
NS	- Insufficient sample.
(a)	- Indicates units were /50ml rather than that shown.

LEGEND

J	- The associated value is an estimated quantity.
U	- The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	- The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.
--	- The parameter was not analyzed.
ND	- The material was analyzed, but not detected above an unstated method detection limit.
TR	- Trace level detection.
<	- Indicates result less than that shown.
>	- Indicates result greater than that shown.
R	- The data was not useable.
NS	- Insufficient sample.
(a)	- Indicates units were /50ml rather than that shown.

LEGEND

J - The associated value is an estimated quantity.

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.

UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.

-- - The parameter was not analyzed.

ND - The material was analyzed, but not detected above an unstated method detection limit.

TR - Trace level detection.

< - Indicates result less than that shown.

> - Indicates result greater than that shown.

R - The data was not useable.

NS - Insufficient sample.

(a) - Indicates units were /50ml rather than that shown.

LEGEND

J - The associated value is an estimated quantity.

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.

UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.

-- - The parameter was not analyzed.

ND - The material was analyzed, but not detected above an unstated method detection limit.

TR - Trace level detection.

< - Indicates result less than that shown.

> - Indicates result greater than that shown.

R - The data was not useable.

NS - Insufficient sample.

(a) - Indicates units were /50ml rather than that shown.

LEGEND

J - The associated value is an estimated quantity.

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.

UJ - The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise.

-- - The parameter was not analyzed.

ND - The material was analyzed, but not detected above an unstated method detection limit.

TR - Trace level detection.

< - Indicates result less than that shown.

> - Indicates result greater than that shown.

R - The data was not useable.

NS - Insufficient sample.

(a) - Indicates units were /50ml rather than that shown.

APPENDIX H

1994 ANALYTICAL ASSESSMENT AND VALIDATION REPORTS

MEMO

TO: Peter Hayes REFERENCE NO.: 1354-30

FROM: Rob Toth/dm DATE: February 7, 1995

RE: **Bayview Park Landfill Site, Burlington, Ontario**
Data Validation for Water Samples Collected April 19, 20 and July 7, 1994

1.0 OVERVIEW

The following memo details an assessment and validation of analytical results obtained from CRA Analytical Services Division (CAS) and Novamann (Ontario) Limited (Novamann) for water samples collected on April 19 and 20, 1994 and July 7, 1994 from the Bayview Park Landfill Site in Burlington, Ontario. All analytical data were assessed and qualified in accordance with protocols established in the USEPA documents "USEPA Contract Laboratory Program National Functional Guidelines for Organic/Inorganic data Review, 1993/1994," (the "Guidelines"). Samples were submitted to CAS and Novamann for the analyses summarized below.

Report ID	*Sampling Date*	*Investigative Parameter*	*Field Samples*	*Field Blanks*	*Duplicates*	*Total*
9404000072 (Novamann)	04-19/20-94	VOCs[1]	12	2	2	16
9404000072 (Novamann)	04-19/20-94	phthalate[2]	1	1	0	2
9404000072 (Novamann)	04-19/20-94	carbaryl	1	1	0	2
9404000072 (Novamann)	04-19/20-94	OC pest/PCB[3]	1	1	0	2
9404000072 (Novamann)	04-19/20-94	OP pesticide[4]	1	1	0	2
941519 (Novamann)	04-19/20-94	metals[5]	1	1	0	2
941519 (Novamann)	04-19/20-94	total cyanide	1	1	0	2
941519 (Novamann)	04-19/20-94	coliforms	9	1	1	11
1354-1 (CAS)	04-19/20-94	general chemistry I[6]	18	3	3	24
1354-1 (CAS)	04-19/20-94	sulphate	18	3	3	24
1354-1 (CAS)	04-19/20-94	general chemistry II[7]	18	3	3	24

---

[1] VOCs - volatile organic compounds

[2] phthalate - bis(2-ethylhexyl)phthalate

[3] OC pest/PCB - organochloro pesticides/polychlorinated biphenyls

[4] OP pesticide - organophospho pesticicdes (diazinon, ethyl parathion and methyl parathion)

[5] metals = molybdenum, zinc, lead, bismuth, cadmium, cobalt, nickel, barium, iron, manganese, chromium, vanadium, aluminum, copper, silver, titanium, antimony, mercury, selenium, arsenic, tin

[6] general chemistry I = alkalinity, chloride, TKN (total kjeldahl nitrogen), ammonia, total phenols

[7] general chemistry II = hardness, BOD, COD, fluoride, total phosphorus, TSS (total suspended solids)

Report ID	Sampling Date	Investigative Parameter	Field Samples	Field Blanks	Duplicates	Total
9407000025 (Novamann)	07-07-94	VOCs	13	2	2	17
942835 (Novamann)	07-07-94	coliforms	10	1	0	11
1354-2 (CAS)	07-07-94	general chemistry I	16	3	3	22
1354-2 (CAS)	07-07-94	sulphate	1	0	0	1

2.0 SAMPLE HOLDING TIMES[1]

By comparing the sampling date of all samples with the reported date of extraction or analysis, the holding time is determined. The maximum holding time is not to be exceeded as this is the maximum time allowed for the sample to be held before initiation of sample analyses; otherwise, the sample results are no longer considered accurate. Table 1 summarizes the applicable holding times.

CAS and Novamann reported all analyses dates for all sampling events and all analyses were completed prior to the expiration of prescribed holding times; therefore, qualifications were not necessary.

3.0 LABORATORY QA/QC

3.1 Laboratory Blanks

The assessment of laboratory blank analyses is conducted to determine the existence and magnitude of contamination problems occurring in the laboratory.

CAS analyzed laboratory blanks for all parameters, for all sampling events and they were found to be non-detect; therefore, qualifications were not necessary.

Novamann report # 941519 (samples collected April 19/20, 1994) indicated that laboratory blanks contained detectable levels of zinc (0.006 mg/L), cadmium (0.0002 mg/L), iron (0.012 mg/L), copper (0.009 mg/L) and tin (0.023 mg/L). As a result of these detectable concentrations of target parameters, qualifications were necessary and can be found summarized in Table 2.

3.2 Surrogate Recovery

Laboratory performance on individual samples is established by spiking activities. Samples for VOC analyses were spiked with toluene-D_8, 4-bromofluorobenzene and 1,2-dichloroethane-D_4. Control limits for these compounds are 82-119%, 76-118% and 69-134% respectively. Samples for PAH analyses were spiked with 2-fluorobiphenyl, terphenyl-D_{14}, nitrobenzene-D_5 and naphthalene-D_8. Control limits for these compounds are 0-130%. Samples for pesticide analyses were spiked with decachlorobiphenyl. The control limit for decachlorobiphenyl is 40-130%. Samples for base neutral

[1] Holding Time: The maximum time, beginning with sample collection, which can be allowed to elapse before extracting or analyzing a sample.

extractables, carbaryl and OP pesticides were spiked with azobenzene. The control limit for azobenzene is 49-120%.

All of the samples for Novamann report #'s 9404000072 (samples collected April 19/20, 1994) and 9407000025 (samples collected July 7, 1994)) showed recoveries within the laboratory control limits; therefore, qualifications were not necessary.

3.3 Method Spike

A method spike sample is an aliquot of reagent-free water which has been spiked with the compounds of interest and is analyzed to ensure that the methodology and instrumentation are in control.

It is noted that method spikes were not performed on the samples submitted to CAS.

Method spikes were performed on all samples for Novamann report #'s 941519 and 9404000072 (samples collected April 19/20, 1994) and 9407000025 (samples collected July 7, 1994). All samples were found to be within acceptable limits with the exception of aldrin (31%); therefore, qualifications were necessary and can be found in Table 2.

3.4 Matrix Spike

A matrix spike is an actual field sample which is spiked with compounds of interest in the laboratory. Matrix spike sample analyses provide information with respect to the effect of each sample matrix on the extraction and measurement methodologies.

It is noted that matrix spikes were not performed on the samples submitted to CAS.

Matrix spike recoveries for metals in Novamann report # 941519 (samples collected April 19/20, 1994) were found to be within acceptable limits (60-140%); therefore, qualifications were not necessary.

3.5 Trip Blank

A trip blank is an aliquot of reagent-free water that is transported to the sampling site and returned to the laboratory without being opened. Trip blanks are analyzed to check sample contamination originating from sample transport, shipping and from site conditions. One trip blank was analyzed by Novamann for all VOC's in Novamann report # 9404000072 (samples collected April 19/20, 1994). All VOCs were found to be non-detect; therefore, qualifications were not necessary.

4.0 FIELD QA/QC

4.1 Field Blanks

The assessment of field blank analyses is conducted to determine the existence and magnitude of contamination problems occurring from both field handling and laboratory procedures. The assessment of field blank results is similar to the process already described for laboratory blanks in Section 3.1.

Three field blanks were submitted for CAS report # 1354-1 (samples collected April 19/20, 1994) and two for CAS report # 1354-2 (samples collected July 7, 1994) to be analyzed for all parameters and were found to be non-detect in all parameters; therefore, qualifications were not necessary.

Two field blanks were submitted for Novamann report # 9404000072 (samples collected April 19/20, 1994) and one for Novamann report # 9407000025 (samples collected July 7,1994) to be analyzed for all parameters and were found to be non-detect in all parameters; therefore, qualifications were not necessary.

One field blank was submitted for Novamann report # 941519 (samples collected April 19/20, 1994) and was found to contain zinc (0.024 mg/L), lead (0.009 mg/L), nickel (0.065 mg/L), iron (0.032 mg/L), aluminum (0.058 mg/L), copper (0.02 mg/L) and tin (0.052 mg/L). As a result of these detectable concentrations of target parameters, qualifications were necessary and can be found summarized in Table 2.

4.2 Field Duplicates

As a check on the combined laboratory and field sampling precision, three sets of duplicate samples (001/005 (HC7-2) , 009/011 (PW3) and 015/017 (SW6-87)) were submitted by CRA and analyzed for CAS report # 1354-1 (samples collected April 19/20, 1994) and for Novamann report # 9404000072 (samples collected April 19/20, 1994) and three sets of duplicate samples (001/005 (SW7-87), 002/006 (HC4-2) and 011/021 (PW1)) were analyzed for CAS report # 1354-2 (samples collected July 7, 1994) and for Novamann report # 9407000025 (samples collected July 7, 1994) for all parameters. A relative percent difference[1] (RPD) was calculated to assess the data in terms of reproducibility.

---

[1] Relative percent difference = RPD = $\left|\frac{X_1 - X_2}{\bar{X}}\right| \times 100$

where X_1 - initial sample result
X_2 - duplicate sample result
$\bar{X}$ - mean of duplicate sample results

All field duplicates had acceptable RPD values (<100%) with the exception of duplicates 001/005 (HC7-2), CAS report # 1354-1 (samples collected April 19/20, 1994), for TKN (135%) and ammonia (180%) and 015/017 (SW6-87) for TKN (111%) and ammonia (173%). As a result qualifications were necessary and can be found summarized in Tables 2.

5.0 SUMMARY

Qualifications were recommended as a result of lab-blank-detected compounds for zinc, cadmium, iron, copper and tin for Novamann report # 941519 (samples collected April 19/20, 1994).

Qualifications were recommended as a result of low method spike recovery for aldrin for Novamann report # 9404000072 (samples collected April 19/20, 1994).

Qualifications were recommended as a result of field-blank-detected compounds for zinc, lead, nickel and aluminum for Novamann report # 941519 (samples collected April 19/20, 1994).

Qualifications were recommended as a result of poor RPD results for field duplicate samples 001/005 (HC7-2) and 015/017 (SW6-87) for CAS report # 1354-1 (samples collected April 19/20, 1994).

All qualifications can be found summarized in Table 2.

The data supplied by Novamann and CAS is acceptable and may be used with the qualifications noted herein.

Dear Mr. Budz:

Re: 1995 Monitoring Report
Bayview Park Landfill Site

Please find enclosed two copies of the above noted report. This report presents and interprets the current and historical surface water and groundwater quality data collected as part of the annual monitoring program.

The 1996 monitoring specifications for the Site will be revised to reflect the rationalized program for the Site. MOEE groundwater and surface water evaluators have provided technical concurrence with respect to the revised program.

Should you have any questions on the above, please do not hesitate to contact our office.

Yours truly,

CONESTOGA-ROVERS & ASSOCIATES

1.0 INTRODUCTION

1.1 HISTORICAL PERSPECTIVE

The Bayview Park Landfill Site (Site) is located on the west side of King Road north of Highway 403 in the City of Burlington (COB), as shown on Figure 1.1. The Site was operated as a landfill by the COB from 1957 to 1972. In 1972, the Site was closed under Ministry of the Environment and Energy (MOEE) Provisional Certificate of Approval No. 210103. The Site is currently operated by the COB as a park facility.

From 1979 to 1985, the MOEE performed Site inspections which included the collection of samples for chemical analysis from leachate seeps around the Site and the upper reaches of Indian Creek. The MOEE's sampling results indicated levels greater than surface water objectives for coliforms and heavy metals, and low levels of chlorinated organic compounds (including PCBs). The sampling results also indicated that the leachate seeps had impacted the water quality in the creek.

In a letter dated May 24, 1985, the MOEE requested that COB respond to the observed leachate seeps and apparent Indian Creek contamination. On May 30, 1985, COB requested that Conestoga-Rovers & Associates (CRA) investigate this issue. The results of this investigation were summarized in a report entitled "Bayview Park Landfill/Indian Creek Contamination Investigation, City of Burlington" dated July 1985. This investigation verified the presence of leachate seeps and contaminated groundwater emanating from the Site and impacting surface water. The report identified a need for the implementation of leachate seepage control measures, and a monitoring program that would evaluate the impact of any control measures installed at the Bayview Park Landfill Site.

In a letter to COB dated October 2, 1985 from B.A. Singh, P. Eng., the MOEE requested:

> *"A comprehensive monitoring program assessing the impacts and recommending controls for gas and leachate both off site and on site is required. We ask that you submit terms of*

reference for this program for approval on or before November 15, 1985."

On behalf of COB, CRA prepared a draft "Terms of Reference 1986 Monitoring Program". In November 1985, this report was submitted to the MOEE for comment. CRA then revised and implemented the 1986 monitoring program to reflect the general intent of the MOEE comments.

Concurrent to the above, CRA designed a leachate collection system (LCS) to control leachate migration. The LCS was approved under MOEE Certificate of Approval (C of A) No. 3-0819-86-007 (Appendix A) dated July 16, 1986. The LCS was constructed in 1986-1987.

On July 16, 1986, the MOEE revoked condition No. 1 of the Provisional C of A No. 210103 dated October 11, 1973 and replaced it with four new conditions. Conditions 1 to 3 dealt specifically with the construction of the LCS. Condition 4 reads as follows:

"The City shall carry out the monitoring and inspection program as approved by the Regional Director with such modification as may be approved from time to time by the Regional Director. On or before March 1st of each year, the City shall file a report with the Regional Director containing an analysis and evaluation of the monitoring and inspection program for the previous year."

Monitoring has been undertaken since 1986 and eight annual monitoring reports have been submitted to the Director as per Condition 4 and are listed within References provided within this report.

1.2 HISTORICAL MONITORING PROGRAMS

The 1986 monitoring program was prepared to evaluate the present environmental impact of the Bayview Landfill Site on surface water, and to provide a basis for evaluating the effectiveness of the LCS. The program included: landfill gas monitoring, leachate levels, leachate seep

inspections, and the sampling of ten surface water locations on a quarterly basis for general chemistry. In addition, ten surface water and sediment samples were sampled on an annual basis for priority pollutant analysis.

Groundwater monitoring was not conducted in 1986 in order that a comprehensive review could be undertaken of the significant groundwater data base that had been developed for the adjacent National Sewer Pipe (NSP) lands to the southeast (which was designated as the proposed Halton Regional Landfill Site F). This comprehensive review of the groundwater database was undertaken as part of the 1986 monitoring program.

Due to the nature of the underlying near surface fractured shale bedrock and the natural poor water quality (i.e., very high chlorides, sulphate, total dissolved solids) it was generally stated that it may not be possible to delineate the extent of groundwater contamination. However, it was ultimately determined that through the presence of organic nitrogen or synthetic volatile organic compounds (VOCs) an approximation of the downgradient extent of contamination be examined.

As a result of the database review, a groundwater component to the annual monitoring program was implemented as part of the 1987 monitoring program. The groundwater component involved the collection of groundwater samples from selected well nests for the analysis of nitrate, nitrite, TKN, and free ammonia. In addition a limited suite of VOCs were analyzed at selected groundwater locations on an annual basis.

The 1986 Monitoring Report largely concluded the following:

1) Prior to the construction of the LCS, surface leachate discharge from the Site had exerted a measurable impact on surface water quality downstream of the Site. However, the impact could not be attributed to leachate seepage alone.

2) No polychlorinated biphenyls (PCBs) were detected in any of the leachate, water, or sediment samples.

3) Groundwater contamination as delineated by organic nitrogen and trichloroethane extended downgradient to, and possibly beyond, Highway 403.

The 1987 monitoring program concluded amongst other considerations that the installation of the LCS had resulted in a reduction of the impact on the surface water quality, however more data was required to further quantify this reduction. Impaired surface water quality was noted at background locations as well as downstream of the Site. No PCBs were detected at any surface water sampling locations. Furthermore, all major leachate seeps identified in 1986 and in 1987 had been contained. It was also determined that organic nitrogen was not a diagnostic indicator of groundwater contamination at this Site and concluded that the source of toluene concentrations within the groundwater be further documented. The recommended 1988 monitoring program included a re-evaluation of groundwater monitoring locations so as to ensure that the wells were screened within the active groundwater flow zones originating from the Site. In addition, those wells completed with suspect well construction materials, such as glued joints, were deleted from the program.

The 1988 report generally reiterated the same conclusions as previously outlined in the 1987 report. Salient conclusions included that the operation of the LCS had resulted in the reduction of impact on the surface water quality, however, more data would be required to fully evaluate the effects of the collection system. The report further concluded that bacteriological parameters were not a useful indicator of groundwater contamination. Also, off-Site groundwater appeared to be characterized by the sporadic occurrence of volatile organics at trace levels which were largely attributed to a natural source. No PCBs were detected within the surface water and further evaluation of background surface water quality was also required. It was further recommended that a refinement in the groundwater monitoring network be undertaken to conduct widespread sampling of the shallow or active groundwater flow zone.

The conclusions presented within the 1989 report are generally consistent with those presented as part of previous reports.

The MOEE provided comments on the 1990 and 1991 Monitoring Reports on November 5, 1992, with the primary MOEE comments presented below:

- "It is very difficult to determine the impacts of leachate on the groundwater system at this Site because of poor background water quality and complex fracture characteristics of the underlying shales. The monitoring program conducted in 1990 and 1991 needs to be continued in order to expand the existing groundwater database. This will enable a more confident interpretation of the groundwater system in the future."

- "It is acceptable to measure leachate levels twice per year instead of four times per year provided there are no noticeable changes to leachate levels in the future."

Consistent with previous reports, the 1992 Monitoring Report found the occurrence of VOCs in leachate and groundwater to be sporadic and characterized by low or trace levels. There was a documented minor impact on general chemistry surface water quality immediately downstream of the Site. In 1992 it was also concluded that surface water quality downstream of the Site along the North Service Road is comparable to background quality, and persistent change in leachate elevations in leachate wells was not evident since installation of the LCS.

The 1993 and 1994 Monitoring Report conclusions concurred with previous monitoring reports, indicating a minor impact of general chemistry parameters in surface water immediately downstream of the Site. Bacteria levels within the surface water were attributed to an upgradient surface water/groundwater source.

In summary, the effectiveness of the LCS has been demonstrated, and historical overland leachate seepage has been controlled

and collected. The impact of the Site on groundwater quality has been difficult to assess due to the naturally poor groundwater quality and lack of proven and effective inorganic indicator parameters of leachate contamination.

1.3 CURRENT SITUATION

The property adjacent (to the southeast) of the Site was formerly owned by NSP. The NSP property was purchased by Jannock Ltd. through its subsidiary 873805 Ontario Inc. Jannock Ltd. is interested in establishing a brick factory and quarry within the licensed portion of the property and will also pursue the development of industrial land fronting on the North Service Road. As such, COB and Jannock Ltd. have undertaken a joint technical review of the performance and impacts of the Site. This review allows COB to determine the most appropriate buffer zone, monitoring requirements, and contingency measures for this closed landfill Site. The results of this review also allows Jannock Ltd. to evaluate the suitability of development of its adjacent lands south of the landfill in accordance with the provisions of the Ministry of the Environment Policy 07-07.

A joint COB/Jannock Ltd. report entitled, "Concept Proposal, Bayview Park Landfill Buffer Zone/Monitoring Requirements and Development of Lands of South of Bayview Park Landfill" dated January 1993, was prepared by CRA/Golder Associates and subsequently presented to the MOEE on February 8, 1993. The MOEE advised that they agree in principal with the Concept Proposal in a letter to COB dated February 23, 1993.

As part of the evaluation of Site Environmental Performance as outlined within the January 1993 Concept Proposal, newly installed observation wells OW1A/B-93, OW2A/B-93, OW3-93, and OW4-93 were sampled on two occasions in April 1993. Proposed surface water sample locations SW9A-93, SW13-93, SW14-93, and SW15-93 were sampled on one

occasion in April 1993. The above groundwater and surface water results are presented in Appendix G.

Subsequently, a report entitled "Environmental Performance Report, Bayview Park Landfill" was prepared and submitted to the MOEE (J. Budz) on November 4, 1994. The purpose of the Environmental Performance Report (EPR) is to present an environmental performance evaluation and rationalized monitoring program for the Bayview Park Landfill Site, based on the proposed Buffer/Alternative zone and recognition of the proposed adjacent land use developments.

Comments on the EPR were received from the MOEE in a letter dated February 22, 1995. CRA, on behalf of COB responded to the MOEE comments in a letter dated April 25, 1995. Both the MOEE and CRA concurred that;

> *"The environmental performance monitoring will be based on the evaluation of water quality trends rather than on the single occurrence or exceedances. It is also recognized that the existing data base needs to be upgraded and that additional work will be required to estimate background values and assess water quality changes."*

Both MOEE groundwater and surface water evaluators have provided concurrence with the proposed EPR monitoring program.

All correspondence between the MOEE and CRA regarding the EPR are provided in Appendix B.

CRA on behalf of COB submitted an application to amend the current C of A, A-2102-05 to the MOEE Approvals Branch on December 7, 1995. The application to amend the current C of A, A-2102-05 is to include the proposed buffer zone lands specified in the EPR. The application form and associated correspondence between MOEE Approvals Branch and CRA are also provided in Appendix B. The proposed amendments to the C of A, is still currently under review by the MOEE Approvals Branch, pending formal notification of the final sale of the subject buffer lands to the COB.

A revised monitoring program will be implemented in 1996 in accordance with the proposed monitoring specifications provided in the EPR.

Comments on the 1994 Monitoring Report were received from the MOEE on July 18, 1995 and September 15, 1995 and are also provided in Appendix B.

1.4 HYDROGEOLOGIC BACKGROUND

As previously outlined, the Site lies adjacent to lands formerly owned by NSP (and currently owned by Jannock Ltd.) which were designated as "Site F" by the Region of Halton in their Waste Management Master Plan. Immediately west of Site F lies the Region of Halton Burlington Landfill Site (BLF). A number of hydrogeological reports addressing Site F, the adjacent BLF and the Site were presented as part of an Environmental Assessment Board Hearing for the selection of a new regional landfill site (CRA, 1988a; Feenstra, 1988; Gartner Lee, 1988; Geocon, 1987; and Trow, 1986).

In summarizing the above noted reports, the Site hydrogeology is characterized by a weathered and fractured shale mantle overlying a less fractured and relatively lower permeable shale bedrock. The fracture pattern within the shale mantle displays considerable variation both vertically and laterally across the Site. The pattern of groundwater flow within this fractured shale mantle is therefore expected to be complex. As shown by Feenstra (1988) the shallow or active groundwater flow system is characterized by low chloride concentrations (<2,000 mg/L) relative to the underlying deep groundwater flow system found at the Site. As shown by Feenstra (1988) this flow system varies from as much as 20 m thick at HC4-85 to 0 m at HC8-85. In general this system varies from 0 to 5 m in thickness downgradient from the Site. Groundwater in this system generally flows laterally through a complex network of interconnected fractures with discharge to surface water bodies.

000925

The underlying deep groundwater flow system is characterized by strong downward gradients and saline groundwaters. Chloride levels commonly exceed 10,000 mg/L in the underlying deep groundwater flow system.

A number of observation well nests and pumping wells were installed by Trow (1986) during the course of the hydrogeologic investigations on Site F. Of these observation well nests, HC4-85, HC9-85 and pumping wells, PW1-86, and PW3-86 that lie generally downgradient of the Site, were incorporated into the 1988 Monitoring Program. In addition, observation well nests HC6-85 and HC7-85, which also lie generally downgradient of the Site, were incorporated into the 1989 Monitoring Program. In 1995, monitoring of these observation wells was continued except at observation well nest HC6-85 (HC6-2, HC6-3) which had been destroyed since April 1990 and at observation well HC4-3 which was destroyed in 1994. Geologic logs and observation well completion records are presented in Appendix C.

2.0 1995 MONITORING PROGRAM

The 1995 monitoring program was designed to continue to evaluate the effectiveness of the leachate collection system (LCS) and to determine if the groundwater and surface water downgradient of the Site is measurably impacted at the monitoring locations. The 1995 monitoring program consisted of the following components:

1) surface water monitoring;
2) leachate well monitoring;
3) leachate collection system monitoring;
4) off-Site groundwater monitoring; and
5) leachate seep inspections.

The monitoring program implemented in 1995 is outlined in Appendix D. Each of the five components of the monitoring program are presented with respect to sampling locations, frequency, monitoring requirements, and analytical requirements if applicable. The monitoring events in 1995 took place on April 5, 1995, July 11, 1995, October 19, 1995, and November 7, 1995.

2.1 SURFACE WATER MONITORING

The 1995 regular monitoring program provided surface water quality monitoring at 12 locations. These locations are provided on Figures 2.1 and 2.2. Samples were scheduled for collection during wet and dry weather, in April and July respectively, and in October if locations were dry during the July event.

Surface water samples were collected from all locations in April 1995 except for SW3-87 and SW11-87 which were reported dry, and at SW4-87 where stagnant water conditions were observed. Only one surface water sample was collected during the July 1995 sampling event at SW10-87. The remaining 11 surface water locations were reported as dry in July 1995. In October 1995, all surface water sample locations were also reported dry.

Therefore, an additional round of surface water sampling was undertaken on November 7, 1995. Samples were collected from all surface water locations in November 1995, with the exception of surface water locations, SW3-87 and SW9-87 which were reported dry. General Chemistry, VOCs, and Bacteriological parameters that were analyzed are presented in Table A.1 of the monitoring specifications provided in Appendix D.

2.2 LEACHATE WELL MONITORING

The six leachate well locations, LW1 to LW6, inclusive are shown on Figure 2.1. The leachate levels were measured on two occasions (April and July 1995) so as to evaluate the LCS. In addition, leachate well depths were measured. Levels were not obtained in LW4 as this well has been obstructed since 1991. In April and July 1995, a level was not obtained in LW2 due to the presence of condensate, on the solinst and "oil" like material in the well.

2.3 LEACHATE COLLECTION SYSTEM MONITORING

Leachate samples were collected from MH15 in April and October 1995. The parameters that were analyzed are outlined in Table A.1 of the Monitoring Specifications outlined in Appendix D.

Monitoring of the leachate flow at MH14 has not been measured since 1993 as an estimated steady state flow of 0.43 m^3/day was established prior to the 1992 Monitoring Report. Leachate discharge flow rates for Pumping Stations #2 and #3 as well as MH14 were recorded for the entire year by COB and are summarized in Appendix E. In order to provide comparative information with respect to LCS annual pumped volumes versus the annual and average precipitation amounts, 1995 precipitation data for the Hamilton Region have been obtained and are summarized in Table 2.1.

2.4 OFF-SITE GROUNDWATER MONITORING

Off-Site groundwater monitoring was performed in 1995 to evaluate the presence of any measurable contamination of groundwater downgradient of the Site. The off-Site groundwater monitoring consisted of two components:

1) obtain representative groundwater data for the shallow or active groundwater flow zone at the pumping wells; and
2) conduct widespread sampling of the shallow or active groundwater flow zone.

In 1995, off-Site groundwater monitoring was conducted in April and July. Eight groundwater monitoring locations, including two pumping wells, PW1-86 and PW3-86, and a total of six observation wells at three observation well nest locations (HC-4, HC-7, and HC-9) were sampled. The off-Site groundwater monitoring locations are shown on Figure 2.3. However, as reported in April 1990, sampling at observation well nest, HC-6 was not possible as these wells have been destroyed. Also, it was determined in April 1994 that observation well, HC4-3 was destroyed. It was proposed that these observation wells be replaced as part of the revised monitoring program as outlined November 1994 Environmental Performance Report. It is anticipated that the abandonment and replacement of buffer zone observation wells will be implemented in 1996. The parameters that were analyzed are provided in the Monitoring Specifications in Appendix D.

The two pumping wells (PW1-86 and PW3-86) were monitored so that representative samples of the groundwater quality downgradient of the Site could be measured. Prior to sampling, each pumping well was pumped for 5 hours. The samples were then obtained using a pre-cleaned bottom loading stainless steel bailer and nylon rope assembly.

Prior to sampling, each observation well was purged, removing a minimum of three times the standing water volume in the well or until dry. In the event that the observation well was purged dry prior to

achieving the three well volumes, the groundwater was allowed to recover to a level adequate for sample collection.

2.5 LEACHATE SEEP INSPECTIONS

Historically, there are nine leachate seep locations on Site. Leachate seep inspections were performed on three occasions throughout 1995 (January 11, April 5, July 11, and October 19, 1995) for seepage reoccurrence at historic seep locations and for the presence of new leachate seeps around the entire Site. The Leachate Seep Inspection Reports for 1995 are presented in Appendix F.

3.0 LEACHATE COLLECTION SYSTEM RESULTS

3.1 LEACHATE WELL LEVELS

Leachate level measurements were conducted on three occasions throughout 1995 (January 11, 1995, April 5, 1995, and July 11, 1995). Historical and current leachate level data are summarized in Table 3.1 and schematically illustrated on Figure 3.1. As noted on Figure 3.1, the LCS was placed on line in December 1986.

Leachate elevations at LW1-86 have remained reasonably consistent since the inception of operations at the LCS. Historically, fluctuations are attributed to seasonal variations in precipitation.

At LW2-86, the leachate elevations have historically remained either just above or below 137 metres above mean sea level (m AMSL) with a few exceptions. On three occasions since installation of the LCS, November 1988, November 1989, and July 1992, the leachate elevation has exceeded 141 m AMSL. These exceptionally high leachate elevations may reflect seasonal trends and/or may be a function of variations in the pumping rates of the LCS. A level of 140.67 m AMSL was obtained at LW2-86 in January 1995 which was slightly higher than historical measurements. The reported presence of "oil" like material and liquid condensate at LW2-86 in April and July 1995 did not allow for the measurement of the leachate levels at this time. As recommended in 1994, a standard plopper and tape assembly was utilized to measure the liquid level at leachate well LW2-86. However, a liquid level could not be measured accurately using this measuring device. An oil/water interphase probe cannot be accessed into the well head of LW2-86 due to the small diameter (1.25 inches) of the well. Renewed attempts to measure the liquid level will be made in future monitoring events utilizing a modified plopper assembly.

Leachate elevations at LW3-86 are historically fairly consistent and have continued to be so throughout 1994.

Leachate well LW4-86 has been obstructed since 1991 and as such no recent leachate elevation levels have been measured. Pre-1991 leachate elevations are fairly stable with no obvious increasing/decreasing elevation trends being noted.

Leachate elevations at LW5-86 remained relatively stable throughout 1995 and consistent with historical data.

The leachate elevations in LW6-86 appears to show some seasonal variation similar to LW5-86 with decreasing levels in the summer and fall.

Leachate contours presented on Figure 3.2 were developed by utilizing leachate levels taken in July 1995 from all available leachate well locations. The leachate levels range from 143.36 to 164.95 m AMSL. As shown on Figure 3.2, the leachate flow is primarily in a southeasterly direction and mimics the underlying topographic slope. The average horizontal gradient across the Site for July 1995 was calculated to be 0.055 m/m. There has been no significant change in the horizontal gradient from initial measurements obtained in January 1986 (0.06 m/m), prior to installation of the collection system.

The leachate elevation monitoring results suggest that any decline in leachate elevation, as a result of the operation of the LCS is minimal. Moreover, the volume of leachate within the Site has not been significantly reduced. As will be discussed in Section 3.2 the LCS has however proven effective in collecting leachate which historically seeped from the Site via toe of slope seepages. Leachate level monitoring should therefore be continued at a frequency of twice per year (April and July) in order to further monitor leachate levels at the Site.

3.2 LEACHATE SEEP INSPECTIONS

Leachate seep inspections were performed at the Site on four occasions: January, April, July, and October throughout 1995. The

inspections are a continuation of the leachate seep inspection program established in 1986. On each occasion, a visual inspection was conducted at nine locations where leachate seepage has occurred historically. The leachate seep inspection locations are identified on Figure 3.3. Leachate seep inspection reports summarizing information pertaining to the condition of the seep locations were prepared during each inspection. The leachate seep inspection reports are provided in Appendix F.

As indicated in the 1986 Monitoring Report, leachate seepage was not observed at any inspection location during the late fall and early winter period following installation of the LCS. Although these locations did not exhibit any leachate seep discharge, they continued to be referred to as Leachate Seeps Nos. 1 through 9 for reference purposes during the 1987 through 1995 inspection programs.

Throughout 1995, leachate seepage was not observed at any of the nine historic leachate seep locations monitored. Soil patches at one location (LS1) was noted as being moist with no obvious overland seepage in April 1995.

In general, there were no changes in vegetation and condition of soil material in any of the historic leachate seep locations in 1995.

In 1992, leachate seepage was observed at LS1. As a result, corrective measures including installation of riprap clear stone and drainage tile connected to the LCS were implemented in July 1992 in the vicinity of LS1. No seepage was observed at LS1 during the latter part of 1992 or during 1993. However, a localized wet soil area was observed at LS1 in both April and July 1994. The area was visually inspected, and reported to not emit a characteristic leachate odour or have a visible sheen in April, July, and October 1995.

3.3 PERFORMANCE OF THE LEACHATE/SHALLOW GROUNDWATER COLLECTION SYSTEM

The LCS is located along the south and west (downgradient) sides of the Site. The LCS consists of perforated pipe collectors and french drains. The pipe collectors generally are located parallel to the toe of the slope of the landfill at a depth of 4 m. The collector pipe consist of polyvinyl chloride (PVC) perforated pipe contained within a 2 m trench backfilled with clear stone. French drains are connected to the collector trenches and run up the landfill slopes into the refuse directly beneath the low permeable cover soils. The french drains are located where persistent leachate seepage through the cover previously occurred. A total of approximately 500 m of collector pipe and 350 m of french drains are in place. As noted earlier, the installation of the sideslope drainage swales and repair to the final cover in the vicinity of LS1 were undertaken in July 1992.

The collector pipe are connected to two pump stations located in deep ravines along the south side of the Site. The pump stations discharge leachate to the Region of Halton Sanitary sewer system for final treatment at the Skyway treatment plant. The King Road Sanitary sewer was extended beneath Highway 403 and up King Road to the Site. Approximately 800 m of gravity sanitary sewer were installed to accept leachate from the Site. The collected leachate is pumped through small diameter forcemains (2-inch and 3-inch) to the gravity sewer. Historically, flow measurements were obtained monthly from the two pump stations and measurements were recorded by COB staff. In 1995 flow measurements were recorded by COB staff on 11 occasions.

Each pump station consists of two pumps which engage on an alternating basis. An elapsed time meter records the run time for each of the two pumps at each of the two stations. Therefore, similar elapsed time readings for each pump indicate normal operation. A copy of all the 1995 pump readings are provided in Appendix E. The total pump hours and total flows for Station No. 2 and Station No. 3 are presented in Table 3.2. The estimated flow for the short lateral collector that discharges to the gravity sewer at MH14 is also presented in Table 3.2. It is evident that the short

000934

lateral collector is a small contributor to the total estimated flow of the collection system. Due to prohibitive confined space entry requirements and cognizant of collected data over the previous 5 years, it was recommended in the 1990 Monitoring Report that an estimated flow rate for the short collector be utilized as part of COB reporting and payment for treatment to the Region of Halton. This estimated flow rate is 0.43 m^3/day.

Based on the sum of the pumped volumes at Pumping Stations 2 and 3 as well as the flow from the short collector at the MH14 weir estimates the total volume of leachate removed by the system is estimated to be 35,173.05 m^3 for the period December 28, 1994 to December 29, 1995. It should be noted that the operational pumping hours and the total volume of leachate discharged has significantly decreased from the reported value in 1994 (54,044.83 m^3), but is comparable to the value reported in 1992 (41,442.58 m^3). The average 1987 to 1995 annual leachate discharge volume is approximately 66,405 m^3. The historical leachate discharge volumes to the Regional sanitary sewer are summarized in Table 3.3.

4.0 ANALYTICAL RESULTS

A description of the sampling program is outlined in the 1995 Site Monitoring Specifications provided in Appendix D. All surface water, groundwater, and leachate samples collected during this investigation were analyzed by the following laboratories:

General Chemistry	CRA Analytical Services (CAS)
Bacteria	NovaMann
Metals	NovaMann
VOC	NovaMann
Base/Neutral/Acid Extractables (BNAEs)	NovaMann
Pesticides/PCBs	NovaMann

The data base containing the current and historical analytical data is compiled in Appendix G. These data were assessed and validated based upon a Quality Assurance/Quality Control (QA/QC) Program. These results are discussed in the following section of this report.

4.1 QUALITY ASSURANCE/QUALITY CONTROL PROGRAM

The analytical data received was assessed and validated by CRA's QA/QC program based upon a review of standard quality control criteria, which include field blank analyses, duplicate sample analyses, travel blank analyses, sample holding times, and laboratory QA/QC procedures.

Field blanks were used to provide an indicator of potential sources of target analyte contamination of the samples during sampling and analysis. A field blank was prepared by pouring Type I deionized water, supplied by the CRA laboratory, into a sample bottle while on Site. According to USEPA guidelines when target analytes are detected within the field blank, only analytical results which were greater than five times the levels reported in the field blank are considered to be true positive detections. Affected results are qualified as "U" - not detected above sample quantitation limit. In

essence, these guidelines correct the reported laboratory method detection limit for contributory influences not reflected in the limitations of the analytical method. The sample quantitation limit (SQL) is the true confidence threshold. Analytes detected at levels below the SQL are not regarded as being true positive detections.

In order to assess sampling variability, duplicate samples were also collected and submitted to the respective analytical facility as part of each sampling event.

Travel (trip) blanks were also collected as part of the QA/QC program. These samples were analyzed for VOCs. The purpose of a trip blank was to determine if cross-contamination occurred during shipping. The laboratory would prepare the trip blanks and send them to the field where they would be left unopened.

Allowable holding time of a sample is the maximum time, beginning with sample collection, which can be allowed to elapse before extracting or analyzing a sample. By comparing the collection date of all samples with the reported date of extraction or analysis, the actual holding time is determined and compared to the allowable holding time.

Analysis of laboratory duplicates, blanks, and check samples were also part of the laboratory QA/QC program. Laboratory duplicates consisted of laboratory prepared duplicates of field samples. The duplicates were prepared by subdividing the sample into two individual samples so that homogeneity was achieved. The purpose of these duplicates was to validate the precision of the laboratory analytical methods employed.

The laboratory performing the analysis would prepare a laboratory blank consisting of de-ionized water on the day the collected samples were to be analyzed. The objective of this blank was to determine the existence and magnitude of contamination, if any, occurred within the laboratory.

The analytical assessment and validation reports are presented in Appendix H. A summary of data qualifications is provided in the attached tables of each data validation report provided in Appendix H. Where appropriate the data qualifications are presented in the data summary table.

4.2 SURFACE WATER

Thirteen surface water sampling locations existed at the Site until the installation of the LCS in 1986, surface water sampling point SW2 was contained by the collection system, and thus no longer exists. Therefore, there are only 12 surface water sampling locations currently at the Site.

The Site monitoring specifications dictate that surface water sampling is to occur in wet weather conditions in April, and dry weather conditions in July, however, if surface water sampling locations are dry in July, surface water samples would be collected in October. During the 1995 sampling period, nine out of the 12 surface water samples were obtained in April 1995; only one surface water sample was collected in July 1995; and no surface water samples were obtained in October 1995, due to dry weather conditions. Therefore, an additional round of surface water sampling was undertaken on November 7, 1995. Samples were collected from all surface water locations in November 1995, with the exception of surface water locations, SW9-87 and SW3-87 which were reported dry. These sampling condition specifications were observed and adhered to for the 1995 monitoring program.

All historical and present surface water data have been recorded in the data base provided in Appendix G.

Field measurements of pH and conductivity were obtained for all surface water monitoring locations in 1995. All surface water samples were analyzed for the following general chemistry parameters:

- alkalinity;
- ammonia nitrogen;
- chloride;
- total kjeldahl nitrogen (TKN);
- phenols; and
- sulphate.

Un-ionized ammonia concentrations were calculated from total ammonia results by applying a correction factor based on the temperature and pH of the surface water. This method of determining un-ionized ammonia concentrations is outlined in "Water Management - Policies, Guidelines, Provincial Water Quality Objectives of the Ministry of Environment and Energy" (July 1994).

Total kjeldahl nitrogen (TKN) is a measure of all the nitrogen in the trinegative state. It is primarily a measure of nitrogen present in the organic form such as proteins, amines, and urea, as well as nitrogen present as free ammonia. The organic nitrogen fraction can be estimated by taking the difference between the free ammonia and the total kjeldahl nitrogen results. Sewage and runoff from agricultural areas where fertilizers have been used are the primary sources of TKN besides the natural nitrogen fixation and anaerobic nitrate reduction processes. The degradation of food wastes may also be a source of TKN.

Priority pollutant VOC indicators and bacteriological parameters were also analyzed for surface water. Historically, fecal coliforms, total coliforms, and fecal streptococci were the bacteriological parameters analyzed. With the issuance of the updated Provincial Water Quality Objectives (PWQOs) by the MOEE in July 1994, Escherichia coli (E. coli) were added to the parameter list. The MOEE standard indicated E. coli is the most suitable and specific indicator of fecal contamination. The analysis of fecal and total coliforms will be continued at the Site to allow for monitoring trends in the water quality with time.

Coliform group bacteria are present in the gut and feces of warm blooded animals. An indication of the remoteness of the source of coliforms is the relative amounts of fecal coliform/and non fecal members of the coliform group. Non fecal members of the coliform group may be expected to survive longer than the fecal members of the group in the unfavourable environment provided by the water. The presence of total coliforms in water is not a specific indication of sewage as fecal pollution but may also indicate soil runoff and also contact with food wastes.

A complete listing of all parameters analyzed for surface water are outlined in the 1995 Site Monitoring Specifications presented in Appendix D.

As reported in the 1989 Monitoring Program Report (CRA 1990), the surface water samples collected in 1989 were during a period of relatively large surface water flow and as such may reflect the improved water quality due to dilution. This was considered when comparing the 1995 results.

It should also be noted that the surface water monitoring analytical list was refined in 1988, as such hardness, iron, DOC, nitrite, and nitrate were removed from the analytical parameter list.

4.2.1 General Chemistry

Background Surface Water Quality Locations:
SW9-87, SW11-87, and SW12-87

The surface water sampling point SW9-87 was established to define the local (background) surface water chemical characteristics in order to differentiate between any impacts related to the landfill and elevated concentrations typical of the area. Surface water locations SW11-87 and SW12-87 were added in the 1987 Monitoring Program so that additional background surface water quality information could be established. A

summary of historical and current surface water quality at the above-noted locations is presented in Table 4.1.

Comparison of historical results at surface water location SW9-87 with the current data indicate that the 1995 values for conductivity, alkalinity, chloride, sulphate, and TKN are comparable to historical values but have shown an increasing trend during the period between 1992 and 1995. The concentrations of coliforms measured in April 1995 are significantly lower than 1994 coliform concentrations and are comparable to historical results. E. coli counts were detected less than ten in the April 1995 sample collected at SW9-87, which is an improvement from the previous monitoring period in July 1994 (540 counts). Concentrations of un-ionized ammonia are lower than available historic results. The background surface water quality monitoring location SW9-87 has shown significant improvement from the previous monitoring round in 1994.

At surface water location SW11-87, samples have only been obtained since 1989 as this location was dry throughout 1987 and 1988. This location was also dry in April, July, and October 1995. However, a surface water sample from SW11-87 was obtained in November 1995. Current and available historic results indicate concentrations of chloride, TKN, and coliforms are present. This indicates an upstream source of animal/fertilizer wastes. Since this is a background surface water monitoring location, an upstream groundwater/surface water source for chloride, TKN, and coliforms is indicated.

The surface water quality in 1995 at surface water location SW12-87 has shown in improvement as compared to the 1994 monitoring results. The 1995 results for surface water location SW12-87 indicate a decrease in TKN and coliform concentrations over the 1994 monitoring period. In November 1995, the un-ionized ammonia concentration represents a decrease from 1994 results and is consistent with historical values.

Summary

For the parameters analyzed, the background surface water quality results in 1995 are below their respective PWQOs with the exception of November 1995 results for coliforms at surface water location SW11-87.

Leachate Seep Surface Water Locations
SW1-87, SW3-87, and SW4-87

Surface water location SW1-87 monitored surface flow and leachate seepage in 1986 near the southern toe of the Landfill area. As shown on Figure 2.1, this point lies immediately outside the collection system. Surface water locations, SW3-87 and SW4-87 also monitored the surface water near the southern toe of the Landfill Site in 1986, but were relocated at a downstream position in 1987. Surface water location SW3-87 was dry or contained stagnant water, throughout the period between 1987 to 1995. Surface water location SW4-87 was dry or contained stagnant water, throughout the period between 1987 to 1995, with the exception of November 1995. It is reasoned that surface water locations, SW3-87 and SW4-87 are essentially dry due to the performance of the LCS. Comments from the MOEE in 1993 suggest moving SW3-87 and SW4-87 further downstream to facilitate sample collection; however, the purpose of the continued monitoring of these locations is to demonstrate that the leachate collection system is effective in the containment of former seepage locations. The observation that these locations are essentially dry confirm that the LCS is operating effectively. At surface water location SW2-87 leachate historically emanated from the toe of the slope at the Site but was contained in 1986 and now discharges directly into the leachate collection system. A summary of the historical and present surface water quality at the former leachate seep locations is presented in Table 4.2.

The reported surface water quality at SW1-87 continues to show improvement in 1995 as compared to that reported prior to the construction of the LCS in 1986. However, the November 1995 results are slightly higher than historical results. The concentration of coliforms have fluctuated in 1995, indicating possible influences from upstream (background)

sources. Concentrations of other parameters remained relatively consistent with historical results.

The 1995 surface water concentrations at SW1-87 are comparable to or lower than those recorded at the background upstream location (SW9-87) with the exception of detected coliform concentrations. Historically, the concentrations of most parameters at surface water location SW1-87 have been slightly elevated compared to the concentrations of surface water location SW9-87. This suggests some minor landfill derived impact or additional loading as a result of groundwater discharge of water that has been impacted by total coliform bacteria.

The November 1995 sample results for SW4-87 demonstrate dramatically improved water quality as compared to the available 1986 result.

Discharge to East of King Road Surface Water Location: SW5-87

Surface water location SW5-87 is located at the culvert which runs east beneath King Road and onto the adjacent Jannock quarry property. Much of the Bayview Park surface water flow drains to this point. It should be noted that some remediation was conducted around surface water location SW5-87 in 1986/1987 in the form of soil cover, regrading, and ditching.

The general chemistry parameter results for surface water location SW5-87 throughout 1986 to 1995 are presented in Table 4.3. Comparing the 1995 results with the 1986 results, indicates that an overall improvement in water quality has occurred at surface water location SW5-87. Detected general chemistry parameters generally decreased from 1986 until anomalously high values were reported in July 1992.

Water quality at surface water location SW5-87 in April 1995 and November 1995 showed an improvement as compared to the July 1992 results, but again an increase in general chemistry analyte concentrations for parameters such as chloride, TKN, and coliform bacteria

was observed in November 1995 as compared to 1992 and 1993 results. E. coli counts for the sample collected at surface water location SW5-87 were determined to be 100J in the November 1995 sampling event.

The surface water samples obtained at SW5-87 in July 1992 and July 1994 are the only two historic samples collected from this location during the summer months. Surface water location SW5-87 has historically been dry during this time period and was also dry in July 1995. This suggests a possible seasonal component to the observed fluctuations, with higher concentrations observed during periods of lower flow (less available dilution).

Surface water location SW5-87 has historically shown elevated levels of conductivity, alkalinity, chlorides, TKN, sulphate, and coliforms when compared to the background surface water location, SW11-87, suggesting minor landfill derived surface water impacts. It should also be noted that coliform bacteria at background surface water location SW11-87 was greater than the coliform bacteria at downstream surface water location SW5-87 which suggests an upstream source of these parameters. The 1995 surface water quality at SW5-87 meets the applicable PWQOs for the analyzed list of parameters (with the exception of coliform bacteria).

King Road and North Service Road Surface Water Location: SW10-87

Surface water location SW10-87 is located at the northeast corner of King Road and North Service Road, approximately 600 m downstream of surface water location SW5-87. The headwaters draining to surface water location SW10-87 are generally located immediately to the east of the Site, but include some surface water drainage from the Site, as measured at surface water location SW5-87.

A summary of historical and current surface water quality at SW10-87 is presented in Table 4.4. Surface water quality at SW10-87 has improved since 1986 with the exception of elevated concentrations of conductivity, chloride, and sulphate.

The 1995 analytical results at surface water location SW10-87 are generally consistent with those results reported in 1994 with the exception of observed levels of conductivity, chloride, and sulphate. Conductivity values of 1,100 to 1,200 umhos/cm in 1995 were greatly in excess of 1994 levels of 600 to 700 umhos/cm. The chloride concentrations ranged between 61.2 to 194 mg/L in 1995 whereas in 1994 levels were less than 41.0 mg/L. Historical levels of sulphate have generally been less than 60 mg/L. The TKN concentrations in April and July 1995 (approximately 0.30 mg/L) are comparable to TKN sample concentrations since 1992. However, the detected concentration of TKN increased to 0.71 mg/L in November 1995. Total coliform concentrations reported in November 1995 (1,800J) represent the highest levels since 1988. E. coli counts at surface water location SW10-87 decreased in 1995 (160 to 950J) when compared to 1994 results (in excess of 1,600).

In comparison with the 1995 data at upstream surface water location SW5-87, downstream surface water location SW10-87 demonstrates improved water quality for the general chemistry parameters, chloride, alkalinity, TKN, and ammonia, but poorer surface water quality as depicted by increased concentrations of conductivity, sulphate, and coliform bacteria.

The surface water quality at SW10-87 meets the established PWQOs with the exception of coliform bacteria drinking water objectives.

North Service Road Surface Water Locations: SW6-87, SW7-87, and SW8-87

Surface water monitoring locations SW6-87, SW7-87, and SW8-87 are located along the North Service Road and are downgradient of surface water monitoring locations SW1-87, SW3-87, and SW4-87 respectively (Figure 2.2). These surface water sampling points are located at a point on the stream upslope from any potential influence of road salting from Highway 403. A summary of the surface water quality for SW6-87, SW7-87, and SW8-87 is outlined in Table 4.5.

000945

All general chemistry parameters reported in April and November 1995 are below 1986 values at surface water location SW6-87. A general trend of improving water quality has evolved since 1986 with the exception of measured sample concentrations of TKN and coliforms.

Comparing the 1995 general chemistry values at surface water location SW6-87 with those reported in 1994 reveals that most parameters have essentially remained the same or increased slightly. Specifically, concentrations of coliform bacteria were slightly elevated above the applicable PWQOs in November 1995 when compared to the sample coliform bacteria levels measured in April 1994.

Comparing the 1995 data at the downstream surface water location SW6-87 with the upstream surface water location SW1-87 indicates that slightly higher results for conductivity, chlorides, and sulphate were detected at the downstream surface water location SW6-87. Lower values of TKN, ammonia, and coliform bacteria were detected at downstream surface water location SW6-87 as compared with upstream surface water location SW1-87.

General chemistry parameter results for surface water location SW7-87 indicate a trend of continued improved water quality since 1986. However, an anomalous decrease in surface water quality occurred in 1993. Coliform concentrations detected in November 1995 were detected above the applicable PWQOs. E. coli counts at surface water location SW7-87 was 120J in November 1995 which was a decrease from the July 1994 E. coli counts which were in excess of 1,600.

In 1995, surface water concentrations at SW8-87 are comparable to those reported in 1993 and 1994 and are within the range historically reported. However, concentrations of TKN (0.51 to 1.46 mg/L) and ammonia (0.02 to 1.38 mg/L) reported in April 1995 are the highest detected concentrations since 1987. Concentrations of coliforms in November 1995 were detected slightly above the applicable PWQOs with E. coli counts of 210. However, the E. coli counts in November 1995 are still lower than the E. coli counts detected in July 1994 (in excess of 1,600).

Aldershot Sampling Surface Water Location: SW13-88

Surface water location SW13-88 is located downstream of the Site, south of Highway 403, near the CNR tracks. This location was incorporated into the 1988 Monitoring Program because of the generally dry conditions encountered in 1987. Some surface drainage from surface water locations SW6-87, SW7-87, and SW8-87 as well as surface drainage from west of the Site are incorporated at this sampling location. A summary of surface water quality is presented in Table 4.6.

The reported concentrations at surface water location SW13-88 are comparable with historical results, with the exception of a slightly elevated concentration of chloride (127 to 177 mg/L) and sulphate (152 to 182 mg/L) reported in 1995. Concentrations at surface water location SW13-88 are generally within the range observed at the upgradient surface water locations, SW6-87, SW7-87, and SW8-87.

4.2.2 Volatile Priority Pollutant Sampling

In April 1995, surface water samples were collected from nine of the 12 surface water locations for priority pollutant VOCs analysis. Surface water locations SW3-87, SW4-87 and SW11-87 were dry, and location SW2-87 no longer exists (see Section 4.2). In July 1995, only one surface water sample (SW10-87) was collected for VOC analysis, while remaining surface water locations were dry. In October 1995, all surface water sample locations were dry, therefore an additional round of surface water sampling was conducted in November 1995. Ten of the 12 surface water locations were sampled for VOC analysis in November 1995.

No VOCs were detected in the surface water samples collected in 1995. The VOC parameters analyzed for surface water are outlined in Appendix D. The surface water VOC results are compiled in the data base presented in Appendix G.

000947

In 1993, the MOEE suggested that additional indicator parameters for leachate [i.e., iron, toluene, and polychlorinated biphenyls (PCBs)] be incorporated into the monitoring program so as to gauge any changes in landfill impacts. However VOCs, including toluene, are already analyzed at the surface water monitoring locations. With respect to PCBs, these parameters have been monitored in the surface water in the past and found to generally not be persistently present. Given the natural presence of iron within the iron rich red shale bedrock area over which the surface water directly flows, iron may not be appropriate as an indicator of landfill derived impacts in surface water. Metals, VOCs, pesticides, and PCB parameters are monitored in the leachate itself to provide a basis for determining whether or not these parameters are of concern to surface water quality. The results of leachate analysis is provided in Section 4.3.

4.2.3 Summary

General chemistry parameter results indicate that surface water quality has improved since installation of the LCS in 1986. Throughout 1986 to April 1992 a trend of progressively improving surface water quality had developed at a number of locations. This trend was disrupted in July 1992 when relatively elevated general chemistry values were reported at a number of surface water locations.

The 1995 results indicate that, in general, alkalinity, hardness, and phenol concentrations at all surface water locations are comparable to recent historic concentrations and are well below 1986 values. Whereas chloride, sulphate, conductivity, TKN, ammonia, and coliform bacteria values have generally increased from recent historic data at the background, landfill vicinity, and downstream surface water locations. These parameter concentrations are still well below 1995 values, however.

An upstream/upgradient surface and groundwater source of coliform, ammonia, and TKN is indicated in one background surface water location (SW11-87).

Volatile organic compounds were not detected at any surface water locations in 1995. This is consistent with historical results.

A comparison of upstream and downstream surface water quality for April 1995 and November 1995 is provided in Tables 4.7 and 4.8, respectively. The landfill appears to be affecting surface water quality as a result of shallow impacted groundwater discharge with respect to generally increase conductivity, chloride, ammonia, and TKN concentrations at landfill vicinity surface water monitoring locations based on a comparison of upstream and downstream surface water monitoring points. Currently there are no PWQOs available for chloride or TKN. Calculated unionized ammonia concentrations are below applicable PWQOs.

Concentrations of coliforms (including E. coli) are found above PWQOs at upstream, landfill vicinity, and downstream monitoring locations.

4.3 LEACHATE/SHALLOW GROUNDWATER COLLECTION SYSTEM MONITORING

Leachate samples from manhole MH15 were collected in April and October 1995 for the analysis of all parameters listed in Table A.1 of the 1995 Site Monitoring Specifications located in Appendix D. The leachate sample was collected at the base of the manhole while the collection system was pumping. The short lateral collectors that joins the main system at MH13 and MH14 were not sampled due to "confined space" entry restrictions. All historical and present leachate chemistry results are presented in the data base in Appendix G.

4.3.1 Metals and General Chemistry - Leachate

The results of leachate analysis for metals and general chemistry are presented in Tables 4.9 and 4.10, respectively. In these tables, the objective column represents the Halton Region Bylaw 192-89 parameters which are the limits for leachate discharge to the sanitary sewer system.

All metals and general chemistry parameters are below their respective objectives with the exception of TKN, which was detected at 110 mg/L in April 1995, thereby slightly exceeding the Halton Regional objective of 100 mg/L as indicated in Table 4.10. This result may be considered anomalous as it is greater than the three previous results of 40 mg/L, 90.9 mg/L, and 36.3 mg/L reported in April 1993, October 1993, and April 1994, respectively. Apart from the anomalous elevated TKN value, the concentrations detected are consistent with that generally found in leachate for a closed municipal landfill.

4.3.2 Priority Pollutants - Leachate

A summary of the 1995 detected priority pollutant parameters in the LCS (MH15) is outlined in Table 4.11. Historical and present data are incorporated in the data base provided in Appendix G.

A total of nine of the priority pollutants were detected during the 1995 Monitoring Program. These detected parameters were VOC compounds: chlorobenzene, 1,4-dichlorobenzene, ethylbenzene, benzene, total xylenes, and toluene; Pesticides: carbaryl; and trace Semi-Volatiles: bis(2-ethylhexyl)phthalate. It should be noted that toluene was not detected in the leachate sample but was detected in the field blank sample (1.0 µg/L). No PCBs were detected within the leachate.

A review of the detected parameters in Table 4.11 indicates that none of these parameters exceed comparative MOEE Drinking Water Objectives.

Historically, the leachate quality has been characterized by sporadic relatively low concentrations of VOCs.

4.4 OFF-SITE GROUNDWATER MONITORING

4.4.1 Introduction

The off-Site groundwater monitoring program was designed to assess the presence of contamination of groundwater downgradient of the Bayview Park Landfill. It is recognized that the Site is old and at present has relatively weak leachate. Previous monitoring programs utilized organic nitrogen as an indicator of groundwater contamination. Results of these investigations show that organic nitrogen was not a useful indicator for illustrating a relationship between organic nitrogen levels in the overburden and the bedrock, nor between background and downgradient locations (CRA, 1988). The 1988 monitoring program concluded that bacteriological parameters were not a useful indicator of groundwater contamination (CRA, 1989). It was also observed that the location of observation well screens in the downgradient monitors had not been demonstrated to be placed within the active groundwater flow zones originating from the landfill. The 1995 Monitoring Program was modelled after the 1990 to 1994 Monitoring Programs, and designed to obtain representative groundwater from the shallow flow system and continue widespread sampling of the shallow or active groundwater flow zone (CRA, 1990).

Pumping wells PW1-86 and PW3-86 were pumped and sampled on two sampling occasions to ascertain the 'average' groundwater quality downgradient of the Site. Pumping well PW1-86 is located approximately 600 m downgradient of the Site, along the North Service Road. This pumping well is completed in the Queenston Shale at a depth of 31.37 m below top of casing (bTOC) within the deep bedrock flow system. Pumping well PW3-86 is located between pumping well PW1-86 and the Site boundary, approximately 160 m downgradient of the Site. Pumping well PW3-86 is located in the Queenston Shale but within the shallow groundwater flow system. Each pumping well was pumped for five hours prior to sampling. The samples were analyzed for general chemistry parameters and VOCs.

In addition, the nest of the observation wells at HC7 (HC7-1, HC7-2), the uppermost two bedrock observation wells at HC4 (HC4-2 and HC4-4), and the two intermediate observation wells monitoring the bedrock and the till/bedrock contact at the HC9 nest (HC9-2 and HC9-3) were sampled in April and July 1995. Observation well HC4-3 (one of the three uppermost bedrock observation wells at HC4 sampled during previous years) was removed from the monitoring program in 1994 because the observation well was reported to have been buried and not possible to sample. The observation wells were monitored for the same suite of general chemistry parameters as the pumping wells. In July 1995 selected observation wells were also analyzed for VOC parameters.

The details of the observation wells included in the 1995 monitoring program are presented in Table 4.12. The historical analytical data for all groundwater monitoring locations are presented in the data base provided in Appendix G.

4.4.2 General Chemistry

The 1995 general chemistry results for PW1-86 and PW3-86 are presented in Table 4.13. The results indicate that values of conductivity, chloride, ammonia, and TKN were significantly higher in PW1-86 than in PW3-86 . Alkalinity was also detected greater in PW3-86 than in PW1-86 . This is consistent with the observations reported in the 1994 monitoring results.

Chloride concentrations in PW1-86 (2,440 to 2,856 mg/L) and PW3-86 (427 to 522 mg/L) exceed the MOEE Drinking Water Objectives (January 1994) of 250 mg/L.

The results for the general chemistry parameters measured at the off-Site observation wells are provided in Table 4.14. The results indicate that with the exception of chloride and pH, all parameters are within the applicable MOEE Drinking Water Objectives. High concentrations of conductivity are observed at all monitoring locations; and high

000952

concentrations of chloride in HC4-2, HC7-1, HC9-2, and HC9-3 are interpreted to represent naturally poor groundwater quality.

The characteristically poor natural groundwater quality and relatively weak leachate quality does not allow for the quantification of leachate impact on groundwater quality.

4.4.3 VOCs in Groundwater

No VOCs were reported above the method detection limit in any of the observation wells or pumping wells during the 1995 Monitoring Program with the exception of toluene which was sporadically detected at low concentrations in all sampled observation wells. This is consistent with historical results.

000953

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 CONCLUSIONS

Based on the available data it is concluded that:

1. No overland leachate seepage was observed at leachate seepage locations in 1995. Moist soil conditions were noted only at location LS-1 on one occasion (April 1995) during the 1995 inspection program.

2. The leachate elevations in the leachate wells do not show persistent change since the installation of the LCS.

3. Surface water monitoring locations SW3-87 and SW4-87 have been essentially dry since the installation of the LCS indicating that the LCS is effective in controlling shallow groundwater and surface leachate seepage discharge.

4. Surface water quality has improved since 1986 at all sampling locations downgradient of the landfill, although a degradation of surface water quality has been generally noticed since 1992 at both background (upstream) and downstream locations. E. coli counts at upstream locations strongly indicate an upstream source of these bacteria.

5. The landfill appears to be affecting surface water quality as a result of shallow impacted groundwater discharge with respect to increased chloride, TKN, and ammonia concentrations at the landfill vicinity surface water monitoring locations as compared with the upstream and downstream surface water monitoring locations. Currently there are no PWQOs available for chloride or TKN. Calculated unionized ammonia surface water concentrations are less than the applicable PWQO.

6. The characteristically poor natural groundwater quality and relatively weak leachate quality does not allow for the ready quantification of leachate impacts on groundwater quality.

7. The occurrences of volatile organics in the leachate and groundwater is generally seen to be sporadic and characterized by low or trace levels only.

5.2 RECOMMENDATIONS

Based on the above conclusions and the findings of the approved Environmental Performance Report, the following recommendations are made:

1. The 1996 monitoring specifications for the Site will be revised to reflect the rationalized monitoring program for the Site. The 1996 monitoring specifications are presented in Appendix I.

Notes:

All results are in mg/L unless specified otherwise.
(1) pH and Conductivity measured in the field in 1987 to 1993, and in the laboratory during 1986
(2) Samples collected in March and May 1987
(3) Surface water sampling location SW-872 does not exist after 1987 as a result of installation of the Collection System
(4) Surface water location SW1-87 was dry in July 1989, August 1990, July 1991, July 1993, October 1993, and October 1995.
(5) Surface water location SW3-87 was dry throughout 1987-1995 sampling periods
(6) Provincial Water Quality Objectives and Guidelines (PWQO/G), MOEE (July 1994).
(7) Guideline no longer in place but used as a benchmark for long-term monitoring, PWQO/G, MOEE (July 1994).
(8) Surface water location SW4-87 was dry throughout 1987-1994, April 1995, July 1995, and October 1995 sampling periods.
(9) Un-ionized ammonia = (Ammonia concentration) x (correction factor). Correction factors (a function of temperature and pH) obtained from Provincial Water Quality Objectives and Guidelines, MOEE (July 1994)
J - The associated numerical value is an estimated quantity
NA - Not analyzed
< - Less than Method Detection Limit
[ ] - Concentration exceeds associated objective

Notes:

All results are mg/L unless specified otherwise
(1) pH and Conductivity measured in the field in 1987 to 1993, and in the laboratory during 1986.
(2) Samples collected in March and May 1987.
(3) Samples collected in March, May and November 1987.
(4) Surface water location SW6-87 was dry in July 1989, August 1990, July 1991, July 1994, October 1994, July 1995, and October 1995.
(5) Provincial Water Quality Objectives and Guidelines (PWQO/G), MOEE (July 1994).
(6) Guideline no longer in place but used as a benchmark for long-term monitoring, PWQO/G, MOEE (July 1994).
(7) Surface water location SW7-87 was dry in July 1989, August 1990, July 1991, October 1994, July 1995, and October 1995.
(8) Surface water location SW8-87 was dry in July 1989, August 1990, July 1991, October 1994, July 1995, and October 1995.
(9) Un-ionized ammonia = (Ammonia concentration) x (correction factor). Correction factors (a function of temperature and pH) obtained from Provincial Water Quality Objectives and Guidelines, MOEE (July 1994).
J - The associated value is an estimated quantity
< - Less than Method Detection Limit
NA - Not analyzed
1,730/1,730 duplicate analysis performed
[ ] - Concentration exceeds associated objective
UJ - The analyte was not detected above the reported quantitation limit, however, the reported quantitation is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

APPENDIX A

CERTIFICATE OF APPROVAL

Ontario

NOTICE

OF THE ENVIRONMENT

JUL 17 1986

CENTRAL REGION
OAKVILLE OFFICE

TO: The Corporation of the
City of Burlington
P.O. Box 5013
426 Brant Street
Burlington, Ontario L7R 3Z6

ATTENTION: MS. HELEN MACRAE, CLERK

Take Notice that condition no. 1 of Provisional Certificate of Approval No. A 210103, dated October 11, 1973, is hereby revoked and replaced with the following conditions:

1. Prior to the excavation of any waste in connection with the construction of a leachate collection system approved under Certificate of Approval No. 3-0819-86-007, the City shall file with the Director of Central Region of the Ministry of the Environment (the Regional Director) plans and design details for the relocating and covering of the excavated waste and the recontouring of the site. No waste may be excavated or relocated without the approval of the Regional Director and except in accordance with such plans and design details.

2. All excavated waste shall be handled in accordance with the "Health and Safety Protocol" described in a letter from Greg Ferraro, P. Eng. of Conestoga-Rovers & Associates Limited, to Lyle Parsons of the Ministry dated July 14, 1986.

3. Surface improvements shall be completed in accordance with Section 8.0 of the "Detailed Design Report, Leachate Collection System and Surface Drainage Improvements" dated June 1986 and the "Contract Documents for Surface Drainage Improvements" and associated Plans 1 to 4 issued June 20, 1986.

4. The City shall carry out the monitoring and inspection program as approved by the Regional Director with such modifications as may be approved from time to time by the Regional Director. On or before March 1st of each year, the City shall file a report with the Regional Director containing a analysis and evaluation of the monitoring and inspection program for the previous year.

The reasons for the imposition of these conditions are as follows:

1. The reason for condition 1 is to ensure that the relocation of the waste i carried out in accordance with a defined protocol. Not doing so may creat a nuisance and would not be in the public interest.

2. The reason for condition 2 is to protect the health and safety of persons involved in the relocation of the waste.

3. The reason for condition 3 is to reduce infiltration of surface water into the site, to eliminate exposed refuse which is creating a nuisance and to ensure proper control of the site.

4. The reason for condition 4 is to provide for the investigation of groundwater contamination in the area of the site and to ensure that the existing surface water contamination problem is abated by the installatio of the leachate collection system.

You may by written notice served upon me and the Environmental Appeal Board within 15 days after receipt of this Notice, require a hearing by the Board.

This Notice should be served upon:

The Secretary

THE CORPORATION OF THE CITY OF BURLINGTON

c/o

has applied in accordance with Section 24 of the Ontario Water Resources Act for approval of:
a fait, conformément à l'article 24 de la loi sur les ressources en eau de l'Ontario, une demande d'autorisation:

A new leachate collection, pumping and transmission system to collect and dispose of (into the City of Burlington's municipal sanitary sewer system) surface leachate and contaminated shallow groundwater from the closed Bayview Park sanitay landfill site bounded by King Road to the northeast and the upper reaches of Indian Creek to the southwest in the City of Burlington, consisting of a toe drain system located at the base of a ravine to the west of the landfill area running approximately 250 metres north of the landfill south property line, two pre-fabricated leachate collection sumps having twin (one duty and 1 standby), 1.5 and 2.0 KW explosion proof submersible type pumps, each pump being rated at:

Pump	Rated Head (m)	Rated Capacity (L/min)
2	17.4	225
3	19.9	200

together with all associated pump level controls, access hatch, electrical control panel internal sump piping, fittings and appurtenances as well as a 200 mm buried perforated PVC leachate collector header at each sump location and 50-75 mm diameter high density polyethylene collected leachate forcemains located along the south edge of the landfill fill area discharging to a 200 mm diameter leachate collection sewer and forcemain, the forcemain section of the sewer being located within the fill area of the landfill (southern edge) for a distance of 120 metres to a height of land with the gravity section of the leachate collection sewer continuing along the south side of the landfill to King Road a distance of 470 m. The sewer then turns south following the west ditch of King Road down to the North Service Road, a distance of approximately 590 metres. The gravity sewer then changes diameter to 450 mm and crosses under the North Service Road and Highway 403 at a point 20 m west of the King Road Overpass. The sewer crosses Highway 403 (a distance of 80 m) and then continues south for 127 metres on the west side of King Road to an existing 450 mm municipal sanitary sewer located on King Road, all in accordance with the documents listed in Schedule "A" (attached) at a total estimated cost, including engineering and contingencies, of EIGHT HUNDRED AND FIFTY THOUSAND DOLLARS ($850,000.00), subject to the following special terms and conditions considered necessary by the undersigned:

....2

Now therefore this is to certify that after due enquiry the said proposed works have been approved under Section 24 of the Ontario Water Resources Act.

Le présent document certifie qu'après vérification en bonne et due forme la construction dudit projet d'ouvrages a été approuvée aux termes de l'article 24 de la loi sur les ressources en eau de l'Ontario.

This certificate supercedes Certificate of Approval No. 3-0819-86-006 issued at Toronto, on June 27, 1986.

NOTICE

TO: The Corporation of the City of Burlington
Box 5013
426 Brant Street
Burlington, Ontario
L7R 3Z6

You are hereby notified that a Conditional Certificate of Approval No. 3-0819-86-007 has been issued to you subject to the conditions outlined therein.

The reasons for the imposition of these conditions are as follows:

1. The filing of as-constructed drawings with the Ministry of the Environment, Environmental Approvals and Land Use Planning Branch is necessary to show that the sewage works were built in conformity with the approved documents listed as Schedule "A" in Certificate of Approval No. 3-0819-86-007 if any questions arise as to what was actually constructed.

2. Liquids from this site contain contaminants which may impair the quality of water in Indian Creek if discharged, contrary to Section 16 of the Act.

You may by written notice served upon me and the Environmental Appeal Board within 15 days after receipt of this Notice, require a hearing by the Board.

This Notice should be served upon:

The Secretary,
Environmental Appeal Board.

DATED at Toronto this 16th day of July , 19 86 .

Director,
Section,
Ministry of the Environment.

1771 (09/84)

SCHEDULE "A"

This Schedule "A" forms part of Certificate of Approval No. 3-0819-86-007 issued on July 16, 1986.

1. Detailed design drawings prepared by Conestoga-Rovers and Associates Limited, Consulting Engineers, issued June 23, 1986 and date stamped July 8, 1986 Environmental Approvals and Land Use Planning Branch entitled Bayview Park Landfill, Leachate Collection System, Contract No. 86-16.

2. Contract Specifications dated June, 1986 entitled City of Burlington, Bayview Landfill Site Leachate Collection System and Surface Drainage Improvements, Contract 86-16, File 760.04-2 (noted by MOE as a second submission).

3. A letter dated June 17, 1986 to Mr. Lyle Parsons from Greg Ferraro, P.Eng. entitled Addendum No. 1, Bayview Park Landfill, Leachate Collection System detailing changes to the Leachate Collection System, Contract 86-16.

4. A letter dated June 23, 1986 to Lyle Parsons, B.E.S. Systems Co-ordinator from Alan Ramsay, Environmental Management Co-ordinator, The Corporation of the City of Burlington, with attached Addendum No. 2, Bayview Park Landfill, Leachate Collection System detailing changes to the leachate pumping system, Contract 86-16.

5. Change Order No. 1 dated June 25, 1986 entitled Corporation of City of Burlington, Bayview Park Landfill, Leachate Collection System Contract 86-16, unsigned.

6. A letter dated June 26, 1986 to Mr. Lyle F. Parsons, B.E.S. Systems Co-ordinator from Greg Ferraro, P.Eng., entitled Change Order No. 1, City of Burlington, Bayview Park Landfill Leachate Collection Systems with attached Appendix A entitled PVC and HDPE Pipe Strength Calculations.

7. A letter dated July 4, 1986 to Mr. T. Armstrong, Acting Director Environmental Approvals and Land Use Planning Branch from Michael N. Boggs, Chief Administrative Officer entitled Bayview Park Landfill Site, Ontario Water Resources Act Application.

Mr. Peter Hayes, B. Sc.
Conestoga-Rovers & Associates Limited
651 Colby Drive
Waterloo, Ontario
N2V 1C2

Dear Mr. Hayes:

Re: Environmental Performance Report, Bayview Park Landfill November 1994, Conestoga Rowers & Associates, for the City of Burlington and Jannok Ltd.

The above referenced report provides a technical evaluation as to the suitability of development of adjacent lands south of the landfill. The report is a follow up of a joint City of Burlington/Jannock Ltd. report "Concept proposal, Bayview Park Landfill Buffer Zone/Monitoring requirements and development of lands south of Bayview Park landfill dated January 1993 prepared jointly by CRA and Golders. Based on a review of monitoring and landfill performance data, the report documents the rationale for a revised monitoring program as well as the requirements for down gradient buffer/attenuation lands. Review comments are as follows:

1. Section 2.1, page 12. Landfill gas monitoring should be included in the current (1994) monitoring schedule.

2. Section 3.0. Field study methodology, instrumentation and sampling QA/QC generally conform to accepted hydrogeological practices.

3. Landfill leachate characterization is discussed under Section 4.3. Representative landfill leachate composition is based on chemical analysis taken from leachate wells and the collection system. Volatile organics most frequently detected in leachate are chlororbenzene, 1,4 - Dichlorobenzene, benzene and toluene. Chlorinated volatile organics could be considered as useful landfill leachate indicators in determining landfill impacts on ground

0781CF (08/94)
0781 CFA (10/93)

100% Unbleached Post-Consumer Stock
100% Unbleached Post-Consumer Stock

water because of the natural poor quality of underlying ground water and difficulty in finding suitable inorganic indicator paramaters.

4.Section 4.4.2.1. Water quality results from the 1993 series of observation wells is discussed, these monitors are screened and positioned in the active shallow flow system down gradient of the landfill. Chloride concentration from two sampling events in March and April are used to establish natural background quality and to assess the effectiveness of the leachate collection system in containing leachate contaminated ground water. Presently, there does not appear to be sufficient data to state that there is no deleterious ground water impact and that the collection system is effectively controlling migration of contaminated ground water within the proposed buffer/attenuation zone. Chloride concentration of 1150 to 936 mg/l in OW1B-93 suggest mixing with deeper seated mineralized water. To determine chloride concentration profiles and to assess natural water quality in shallow downgradient wells,the existing data base will need to be expanded.
The report recommends that sodium and potassium be included in the list of chemical paramaters to be tested in the proposed rationalized monitoring program. These values are to be used in trilinear plots of major ion ratios to assist in identifying apparent mixing of landfill leachate with ground and surface waters. There is no description of the method that will be used. Will the plotted data distinguish between leachate impacted ground water and shallow ground water mixed with deeper seated mineralised water.

The significance of low levels of benzene, ethyl benzene, xylene and toluene in the March sampling event is of some concern. Although BTEX compounds are known to occur naturally in some bedrock waters, additional work is required to show that the presence of these compounds is not landfill related.

5.Section 7.0. The buffer/attenuation zone area is shown in Drawing 1 and Figure 3.1. this area will be used for ground and surface water and landfill gas monitoring.The rationalized monitoring program is designed to measure ground water quality changes at the downgradient buffer zone boundary.The report states that the buffer/attenuation zone will allow for the attenuation of landfill derived contaminants and provide for boundary impact monitoring capabilities, in addition the buffer area would facilitate assess to the landfill collection system and provide land for contingency measures if required.While agreeing that the buffer zone will meet these requirements it is not clearly demonstrated that landfill derived impacts are completely eliminated in the buffer zone area. Further, what is the criteria to be used at the downgradient buffer boundary to establish water quality changes?

To summarise, the rationalized monitoring program for ground water outlined on Table 8.1 is generally acceptable. It must be recognised,that the current monitoring program is in its early stages and additional work is required to estimate background values and establish concentration trends. Modifications to the program may be necessary at some later date as the data base is expanded.Comments on the revised surface water monitoring are being addressed separately.

If you need clarification on the above, please call me at (905)815-5931.

Yours truly,

T. Brenkovic, P. Eng.,
District Engineer
Halton-Peel Region

Reference No. 1354

Mr. Tom Brankovic
Ministry of Environment and Energy
Halton-Peel District Office
1235 Trafalgar Road, Suite 401
Oakville, Ontario
L6H 3P1

Dear Mr. Brankovic:

Re: Response to MOEE Comments
Environmental Performance Report
Bayview Park Landfill
City of Burlington, Ontario

Comments prepared by the MOEE regarding the groundwater component of the above-noted report are outlined in a letter to Mr. Peter Hayes dated February 22, 1995. Comments on the surface water monitoring were not included in this letter and will be addressed separately. A copy of the MOEE letter is included in Attachment A of this letter for ease of reference.

This letter provides CRA's responses to the MOEE Comments on a point-by-point basis:

1. MOEE Comment: Section 2.1, page 12

Landfill gas monitoring should be included in the current (1994) monitoring schedule.

CRA Response

The 1994 monitoring (Appendix B) schedule did not incorporate monitoring of landfill gas, as this was intended to be incorporated once, MOEE concurrence was received with respect to the rationalized monitoring program. As indicated in page 38 of the Environmental Performance Report, landfill gas monitoring will be conducted two times annually at each of the three gas probes (GP1-93, GP2-93 and GP3-93) monitoring locations. Landfill gas monitoring will only be included as part of the current monitoring schedule, when the monitoring program (both surface water and groundwater) and the extent of the proposed Buffer/Attenuation zone as proposed with the Environmental Performance Report is approved by the

MOEE. It should be noted that there are currently no structures in the vicinity of these boundary gas probe locations.

2. MOEE Comment: Section 3.0

Field study methodology, instrumentation and sampling QA/QC generally conform to accepted hydrogeological practices.

CRA Response

We are in agreement, no response required.

3. MOEE Comment

Landfill leachate characterization is discussed under Section 4.3. Representative landfill leachate composition is based on chemical analysis taken from leachate wells and the collection system. Volatile organics most frequently detected in leachate are chlorobenzene, 1,4-Dichlorobenzene, benzene, and toluene. Chlorinated volatile organics could be considered as useful landfill leachate indicators in determining landfill impacts on ground water because of the natural poor quality of underlying groundwater and difficulty in finding suitable inorganic indicator parameters.

CRA Response

It was indicated on page 31 of the Environmental Performance Report that "the presence of chlorinated volatile organic compounds are also considered as diagnostic indicators of landfill derived groundwater impact".

Given the historic difficulty in the evaluation of inorganic parameters as indicators of landfill-derived impact on groundwater quality, trends in inorganic parameters (see Response to Comment #4) will be evaluated in conjunction with trends in chlorinated volatile organic and BTEX compounds to determine the potential impact of the landfill on groundwater quality.

4. MOEE Comment: Section 4.4.2.1

Water quality results from the 1993 series of observation wells is discussed, these monitors are screened and positioned in the active shallow flow system downgradient of the landfill. Chloride concentration from two sampling events in March and April are used to establish natural background quality and to assess the effectiveness of the leachate collection system in containing leachate contaminated ground water. Presently, there does not appear to be sufficient data to state that there is no deleterious ground water impact and that the collection system is effectively controlling migration of contaminated groundwater within the proposed buffer/attenuation zone. Chloride concentration of 1150 to 936 mg/L in OW1B-93 suggest mixing with deeper seated mineralized water. To determine chloride concentration profiles and to assess natural water quality in shallow downgradient wells, the existing database will need to be expanded.

The report recommends that sodium and potassium be included in the list of chemical parameters to be tested in the proposed rationalized monitoring program. These values are to be used in trilinear plots of major ion ratios to assist in identifying apparent mixing of landfill leachate with ground and surface waters. There is no description of the method that will be used. Will the plotted data distinguish between leachate impacted groundwater and shallow groundwater mixed with deeper seated mineralized water.

The significance of low levels of benzene, ethylbenzene, xylene and toluene in the March sampling event is of some concern. Although BTEX compounds are known to occur naturally in some bedrock waters, additional work is required to show that the presence of these compounds is not landfill related.

CRA Response

It is realized that the existing database will need to be expanded in order to assess natural water quality in shallow downgradient wells. It should also be noted that no single parameters or sampling events are or will be used to identify the potential impact of landfill-derived leachate on groundwater quality. Rather, an evaluation of all parameters (inorganic, BTEX and chlorinated volatile organic compounds) and trends in water quality will be

used to identify the potential impact of landfill-derived leachate in the quality of downgradient groundwater.

It was recommended in p. 37 of the Environmental Performance Report that sodium and potassium be included in the list of chemical parameters to prepare major ion ratio plots and not trilinear plots. It is proposed to plot potassium/sodium (K/Na) vs. chloride/alkalinity (Cl/Alk) ratios in order to identify apparent mixing of landfill leachate with ground and surface waters. The existing leachate characterization data provided in Table 4.1 of the Environmental Performance Report indicate that the leachate contains relatively high concentrations of chloride (3,230 mg/L) and alkalinity (3,370 mg/L). The leachate is also comprised of relatively high concentrations of potassium (137 mg/L) and sodium (371 mg/L). Based on the above data, the Cl/Alk and K/Na ratios for the leachate are on the order of 1 and 0.5, respectively. The existing groundwater general chemistry data presented in Table 3.7A of the Environmental Performance Report indicates that the Cl/Alk ratios for shallow groundwater are different than the Cl/Alk ratio of 1 for leachate. The Cl/Alk ratios for shallow groundwater are generally less than 0.5. The ratios for deep mineralized or mixed shallow and deep mineralized groundwater are 5 or greater.

The potassium and sodium data will be used to determine the K/Na ratios for groundwater and these in turn will be employed to further assess if potential mixing of landfill leachate and groundwater occurs.

As indicated in the Environmental Performance Report, the emphasis will be placed on the evaluation of trends rather than single occurrences/detections in the ground and surface water quality.

The significance of low levels of BTEX compounds will be further evaluated as additional groundwater quality is obtained. Again, emphasis will be placed on the evaluation of trends in water quality (i.e., BTEX, chlorinated volatile organic compounds and inorganic parameters).

5. <u>MOEE Comment: Section 7.0</u>

The buffer/attenuation zone area is shown in Drawing 1 and Figure 3.1. This area will be used for ground and surface water and landfill gas monitoring.

The rationalized monitoring program is designed to measure groundwater quality changes at the downgradient buffer zone boundary. The report states that the buffer/attenuation zone will allow for the attenuation of landfill derived contaminants and provide for boundary impact monitoring capabilities, in addition the buffer area would facilitate assess to the landfill collection system and provide land for contingency measures if required. While agreeing that the buffer zone will meet these requirements it is not clearly demonstrated that landfill derived impacts are completely eliminated in the buffer zone area. Further, what is the criteria to be used at the downgradient buffer boundary to establish water quality changes?

CRA Response

The proposed buffer/attenuation zone is intended to allow for control for the purposes of monitoring and the implementation of any additional management practices that may be required. In addition, the criteria to be used at the downgradient buffer boundary to establish water quality changes will be based on the evaluation of trends in water quality for all parameters (i.e., BTEX, chlorinated volatile organic compounds and inorganic parameters).

6. MOEE Comment: Section 7.0

To summarize, the rationalized monitoring program for groundwater outlined in Table 8.1 is generally acceptable. It must be recognized, that the current monitoring program is in its early stages and additional work is required to estimate background values and establish concentration trends. Modifications to the program may be necessary at some later date as the database is expanded.

CRA Response

It is realized that the current monitoring program is in its early stages and that additional work is required to estimate background values and establish concentrations trends.

As previously indicated emphasis will be placed on the evaluation of trends in water quality rather than the evaluation of single occurrences of detections.

April 25, 1995 Reference No. 1354

Modifications to the monitoring program will be performed if the evaluation of the expanded database indicates that this is necessary.

Both the City of Burlington and Jannock Ltd. would like to initiate the Proposed Site Monitoring Program Specifications (Table 8.1) as soon as practical. As stated on pg. 39 of the Environmental Performance Report; the proposed program will not be implemented until the MOEE has approved both, the complete monitoring program, and the limits of the Proposed Buffer/Attenuation zone. It is our understanding that a surface water MOEE reviewer has yet to review the Environmental Performance Report, your best efforts to expedite the review process would be appreciated. Also, please recall, that the COB would like initiate discussions with regards to any amendments to the Certificate of Approval which may be appropriate to reflect the legal definition of the site given the additions of downgradient buffer/attenuation zone lands.

Should you have any questions on this matter, please do not hesitate to contact us.

Yours truly,

CONESTOGA-ROVERS & ASSOCIATES

Peter Hayes, B.Sc.

RE: Bayview Park Landfill, City of Burlington
CRA Letter Ref No. 1354, dated April 25, 1995

I have received and looked at Conestoga-Rovers & Associates reply to the MOEE comments in their letter report dated April 25, 1995.

CRA have satisfactorily addressed the concerns/questions raised in our review comments of the Environmental Performance report. As indicated in the CRA response, the emphasis in the environmental performance monitoring is on the evaluation of water quality trends rather than on single occurences or exceedences. It is also recognised that the existing data base needs to be upgraded and that additional work will be required to estimate background values and assess water quality changes.

I hope you find the above in order.

MEMORANDUM

TO: Tom Brankovich
Oakville District Office

FROM: Jimmy D' Cruz
Technical Support

RE: Bayview Park Landfill Site, 1994 Monitoring Report
Conestoga - Rovers & Associates Limited, March 1995

The above referenced report presents an analysis of results of the 1994 monitoring. The following under mentioned comments relate specifically to ground water quality impact assessment and evaluation of the effectiveness of the leachate collection system.

1. Monitoring and analysis of leachate elevation data indicate that there is no significant change in leachate levels and in corresponding leachate volumes within the site. Field inspections indicate that leachate seepages are generally under control. Except for wet soil conditions observed at locations LS-1, LS-7 and LS-8, no leachate breakouts or overland seepages were observed.

2. Off site ground water quality monitoring results indicate that with the exception of chloride all the other chemical paramaters tested for are within Ontario Drinking Water Objectives. The deeper flow system is characterized by chloride concentrations generally exceeding 10,000 mg/l, the shallow flow system shows relatively lower concentrations of less than 2000 mg/l. The high chloride concentrations in the shallow zone represents the natural background quality of water found at the site.Because of the high concentration of chlorides and relatively weak leachate composition found at the site, chlorides are not considered a suitable contaminant indicator. Previous monitoring (CRA, 1988), also ruled out organic nitrogen as a useful leachate indicator (CRA, 1988). Currently there is no leachate related contaminant indicator to detect ground water quality change. In the Environmental Performance Report dated Nov,1994, CRA proposed trilinear plots of select cation/anion ratios as a means of identifying leachate impacted waters from shallow ground waters mixed with naturally occurring mineralised water.

(5)

This is one possible approach that could be used to determine landfill leachate contamination from naturally mineralised ground waters.

3. The monitoring program for 1995 outlined in Appendix D appears to be satisfactory.

MEMORANDUM

To: Tom Brankovic
Oakville District Office

From: Ellen Schmarje

Re: Bayview Park Landfill Site
1994 Annual Status Report, March 1995
& Environmental Performance Report, Nov. 1994
Burlington, Ontario
File: WA450202, SW24-0205

I have reviewed both of the above reports with respect to surface water impacts.

The landfill does appear to be affecting the surface water quality at the monitoring locations adjacent to, or immediately downgradient of the landfill, as compared with upstream and downstream monitoring points. However, the impact appears to be minor at this time, and continued monitoring should confirm this and detect any worsening.

The revised monitoring locations proposed in the Environmental Performance Report appear appropriate to monitor any changes in surface water quality.

Since it is proposed that the revised monitoring program be conducted only twice per year, if stations are dry on both occasions, then a third sampling run should be attempted in the fall.

The leachate should continue to be analyzed for phenols and toluene (if not already included in the parameter list). If either of these parameters are detected in consecutive samples, they should be added to the surface water monitoring program.

(5)

To summarize, the rationalized surface water monitoring program is generally acceptable, with the above conditions. Modifications to the program may be required at a later date.

If you have any questions regarding the above, please don't hesitate to call me.

Application for Approva of a Waste Disposal Site

Ptn # 6

FOR OFFICE USE ONLY				
Application Number(s)	Client Number	Payment Received	Date	Initials
		$		

Ce formulaire est disponible en français

Information requested by this form is collected under the authority of the *Environmental Protection Act*, R.S.O. 1990 (EPA), Chapter E-19, (EPA) and the *Environmental Bill of Rights*, c.28, Statutes of Ontario, 1993, (EBR) and will be used to evaluate applications for approval of waste disposal sites according to the requirements of the EPA. Questions should be directed to the Approvals Branch, 250 Davisville Avenue, 3rd Floor, Toronto, Ontario, M4S 1H2, Telephone No. (416)440-3713 or 1-800-461-6290, or to your local Ministry of Environment and Energy District Office.

Instructions

1. When completing this form, please refer to the "Guide For Applying for Approval of Waste Disposal Sites", Sections 27, 30, 31 and 32, EPA (referred to as the Guide).

2. This form must be completed with respect to all the requirements of the Guide in order for it to be considered as an application for approval. INCOMPLETE APPLICATIONS WILL BE RETURNED TO THE APPLICANT OR DENIED APPROVAL.

3. A complete application for approval consists of;
   (1) a completed and signed application form;
   (2) all supporting information as requested by this form and by the Guide; and
   (3) a certified cheque or money order for the approval fee, if applicable.
   The Ministry may require additional information following a review of the complete application.

4. Two (2) copies of the application together with the supporting information must be submitted to the Ministry of Environment and Energy,
   One copy to: Director of Approvals Branch, Ministry of Environment and Energy,
   250 Davisville Avenue, 3rd Floor, Toronto, Ontario, M4S 1H2

   OR

   Regional Director in the region in which the site is located/will be located

   A duplicate copy must be sent to the District Office having jurisdiction over the area in which the works will be located.

5. Information contained in this application is not considered confidential and will be made available to the public upon request. Certain information submitted as supporting information may be claimed as confidential but will be subject to the *Freedom of Information and Protection of Privacy Act* (FOIPOPA) and EBR. If you do not claim confidentiality at the time of submitting the information, the Ministry may make the information available to the public without further notice to you.

6. PROJECT/APPLICATION DESCRIPTION – R Abstract (Brief description of the proposal)

The Bayview Park Landfill Site was closed in 1973 and has since been operated as a park facility. A leachate collection system which collects surface leachate flows and impacts shallow groundwater for discharge to the Regional Municipality of Halton sanitary sewer system was subsequently constructed and has operated since 1986. Downgradient land adjacent to the Bayview Park Site, on which the leachate collection system is situated is being purchased by the City of Burlington as buffer lands, from Jannock Properties. Lands to be purchased are shown on attached site plan (reference Item 8) and survey plans (reference Item 9 and 10). Note: A small "tailpiece" portion of land that was originally proposed to be part of the proposed buffer zone in November 1994 is not included. These lands represent a road access for the Jannock property. The buffer zone as now outlined will provide for the purposes set forth in the Environmental Performance Report Section 7.0.

7. EBR REQUIREMENTS

Is this a Prescribed Instrument under EBR?	☒ Yes, Class of Instrument? II	☐ No
If a Prescribed Instrument, is it excepted from public notification?	☒ Yes	☐ No
If it is excepted from EBR, provide reason	☐ Emergency	☐ Equivalent Public Participation
	☐ EAA or Tribunal Decision	☒ Environmentally Insignificant amendment or revocation

If exempt from public notification, documentation in support of the noted exception must be provided.

8. PUBLIC CONSULTATION/NOTIFICATION– Specify all public consultations/notification (such as public meetings, notification of First Nations etc.) that has been completed or is in the process of being completed.

See attached letters and Memorandum from MOEE and CRA dated February 22, 1995 (Ref 3)

June 21, 1995 (Ref 5)
Sept 15, 1995 (Ref 6)

9. OTHER APPROVALS/PERMITS – List all other environmental approvals/permits applied for related to this project or received under the EPA (discharges to air, waste management, sewage systems, etc.) and the Ontario Water Resources Act (OWRA) (water works, permit to take water, etc.).

Certificate of Approval for Industrial Sewage Works 3-0819-86-007 (attached Ref 7)

10. PROJECT SCHEDULE

Estimated Date for Start of Construction	Estimated Date for Start of Operation

11. FEE ESTIMATE – The "cost" to used to estir the fee includes all equipment and construction cos' ' does not include costs for land, engineering services and costs of ies for which the permit or approval is applied for ur ther Sections of the EPA or the OWRA for which appropriate fees have or will be paid. The fee shall not be less than $50.00 or more than $100,000.00. (For more information refer to the Guide)

(1) The fee payable upon submission of an application under Section 27 or the EPA where the application relates to a waste disposal site other than a landfilling site is:

(a) 2% of the cost of the equipment and construction related to the application, less

(b) an amount equal to the proportion of the waste that is received at the site and will leave the site for recycling or reuse to the total amount of waste received at the site, calculated by weight or by volume, multiplied by the amount referred to in clause (a).

(c) where additional approvals are required under other Sections of the Act, separate fees are also required.

(2) For the purpose of clause 1 (a), recycled or reused waste does not include waste intended to be used as a dust suppressant or as a fuel or intended to be disposed of at a landfilling site or incinerator.

(3) The fee payable upon application under Section 27 of the EPA where the application relates to a landfilling site is 4 cents per cubic metre of the capacity of the landfilling site.

Estimated Fee ($50.00 minimum, $100,000.00 maximum) $ 50.00 Cheque or Money Order Attached [X] Yes [ ] No

When an application is submitted to the Ministry for review the fee must be in the form of a certified cheque or money order payable to "The Minister of Finance".

DO NOT SEND CASH

Conestoga-Rovers & Associates Limited
651 Colby Drive
Waterloo, Ontario
N2V 1C2

Dear Mr. Hayes:

RE: APPLICATION TO AMEND THE CERTIFICATE OF APPROVAL FOR THE BAYVIEW PARK LANDFILL, BURLINGTON, ONTARIO

In order to proceed with your application of December 7, 1995, I need your clarification of the following issues:

- What is the current status of the proposed buffer/attenuation zone? Did the COB acquire this zone and if so, when? Did the COB obtain groundwater rights within this property and if so, when?
- What is the current status of wells OW1A, 1B-93 and OW2A, 2B-93 referred to on page 34 of the Environmental Performance report?
- There are some minor discrepancies in the shape of the northwestern segment of the proposed buffer/attenuation zone shown on Fig. 3-1, Drawing N1 dated May, 1993 from the report, Drawing N1 (Reference Item 8) dated November, 1995 and Plans 20R-11536, 11537 (Reference Items 9 and 10). Which area is correct and correspond to the 11.23 ha. area referred to in an application?
- Do you want to incorporate the proposed buffer/attenuation zone into the new site boundary?

Please be advised that I do not agree with your assessment that an amendment you apply for is environmentally insignificant; therefore, EBR is required.

If you have any questions, please do not hesitate to call me.

Yours very truly,

E. Zaltsberg

M4S 1H2

Dear Mr. Zaltsberg:

Re: Application to Amend the Certificate
of Approval for the Bayview Park Landfill
Burlington, Ontario

In response to your letter of January 17, 1996, Conestoga-Rovers & Associates (CRA) prepares the following response to your concerns regarding the above-noted Certificate of Approval (C of A) application submitted on December 7, 1995 by the City of Burlington (COB).

MOEE Comment #1

What is the current status of the proposed buffer/attenuation zone? Did the COB acquire this zone and if so, when? Did the COB obtain groundwater rights within this property and if so, when?

CRA Response #1

There is an agreement to purchase the buffer/attenuation zone between the COB and Jannock. Further to recent communication between CRA and COB, it is understood that there are three minor outstanding conditions to be dealt with prior to formal completion of the buffer/attenuation zone acquisition. These are:

(a) consents for dismissal of previous actions;
(b) releases specifically relating to the past actions; and
(c) that both parties will agree to provide a warning clause in the subdivision agreement, which largely relates to the fact that the Subject lands are adjacent to the closed Bayview Park Landfill Site.

It is anticipated the property transaction will be formerly completed by the end of March 1996. The COB as owner of the subject lands will obtain groundwater rights within the buffer/attenuation zone when the property transfer is complete.

MOEE Comment #2

What is the current status of wells OW1A, 1B-93 and OW2A, 2B-93 referred to on page 34 of the Environmental Performance report?

CRA Response #2

The above noted monitoring well nests, as well as monitoring wells OW3-93 and OW4-93 have been installed within the buffer/attenuation zone, and along with well PW-3 are proposed to replace the current groundwater monitoring network in-place at the Site. It is also proposed to abandon the monitoring wells which comprise the current monitoring network.

The monitoring specifications involving these seven monitoring wells are outlined within Reference Item #13. This monitoring program will be implemented beginning in April 1996.

MOEE Comment #3

There are some minor discrepancies in the shape of the northwestern segment of the proposed buffer/attenuation zone shown on Figure 3-1, Drawing N1 dated May 1993 from the report, Drawing N1 (Reference Item 8) dated November, 1995 and Plans 20R-11536, 11537 (Reference Items 9 and 10). Which area is correct and correspond to the 11.23 ha area referred to in the application?

CRA Response #3

As outlined in Section 6 of the C of A Application dated December 7, 1995, the small portion of land causing the discrepancy was originally proposed to be part of the buffer/attenuation zone on Figure 3.1/Drawing No. 1 within the Environmental Performance Report in November 1994 (Reference Item #11). However, these lands represent an access road for the Jannock property and as such, will remain in Jannock's control.

A close examination of an updated version of the above noted Drawing (Reference Item #8), indicates this land as being previously proposed as part of the buffer/attenuation zone, and is to remain in Jannock's control. Therefore Drawing No. 1 dated November 1995 (Reference Item #8) supercedes Drawing No. 1 dated November 1994 (within Reference Item #11). Reference Item #8 also agrees with Reference Items #9 and #10, and therefore accurately represents the total 11.23ha area referred to within the C of A Application.

MOEE Comment #4

Do you want to incorporate the proposed buffer/attenuation zone into the new Site boundary?

CRA Response #4

Yes, the intent of the application for amendment to the C of A is to have the Site property boundaries modified to reflect the acquisition of the buffer/attenuation zone by the COB.

CRA trusts that the above clarifications will be sufficient to allow for the processing of the C of A Application to proceed once the property transaction is completed. We will inform you when this occurs and provide you with appropriate documentation to that effect. As discussed, once the property transaction is complete the MOEE will then proceed with the processing of the application. Should you have any further questions or concerns, please contact our office.

Yours truly,

Dear Mr. Zaltsberg:

Re: Application to Amend the Certificate of Approval for the Bayview Park Landfill Burlington, Ontario

As per our recent telephone conversation, please find enclosed a revised project description to replace the description included in Section 6 of the original C of A application dated December 7, 1995. This description has been prepared as per your request for use as part of the EBR Bulletin Board posting.

> *The Bayview Park Landfill Site was closed in 1973, and has since been operated as a park facility by the City of Burlington. A leachate collection system which collects impacted shallow groundwater for discharge to the Regional Municipality of Halton sanitary sewer system was subsequently constructed and has operated since 1986 under the appropriate Certificate of Approval for Industrial Sewage works. Downgradient lands adjacent to the Bayview Park Site, on which the leachate collection system is situated are being purchased by the City of Burlington for use as buffer lands. A network of seven monitoring wells have been installed within the buffer lands, and will be monitored semi-annually for general chemistry and VOC analytical parameters, to quantify that no adverse impacts on the groundwater regime are occurring. A total of eight upstream, landfill vicinity, and downstream surface water monitoring locations are also included as part of the semi-annual monitoring network. Surface water samples will also be analyzed for general chemistry and VOC analytical parameters, as well as for bacteria.*

CRA trusts that the above is satisfactory, and will be amended to the original application. As discussed in our letter dated January 31, 1996, CRA will inform you

when the property transaction is complete, at which point the MOEE will proceed with the processing of the application.

Should you have any further questions or concerns, please contact our office.

Yours truly,

CONESTOGA-ROVERS & ASSOCIATES

Peter Hayes, B.Sc.

Dear Mr. Hayes:

RE: APPLICATION TO AMEND THE CERTIFICATE OF APPROVAL FOR THE BAYVIEW PARK LANDFILL

Thank you very much for your letter of February 6, 1996.

As discussed before, when the property transaction is completed and confirmed, I will send your application along with the updated EBR abstract to the EBR office.

If you have any questions regarding this matter, please give me a call.

Yours very truly,

E. Zaltsberg

1995 MONITORING PROGRAM

CONESTOGA-ROVERS & ASSOCIATES
1995 SITE MONITORING SPECIFICATIONS

PROJECT: Bayview Park Landfill Site

PROJECT NO.: 1354-30

PROJECT MANAGER: Peter Hayes

PROJECT COORDINATOR: Jo-Anne Ing

MONITORING STAFF:	RESPONSIBILITY
Roger Waller	Field Technician
Dan Daum	Field Technician
Rob Toth	Coordinator/Chemist QA/QC

LABORATORY USED: CRA Analytical Services (CAS), Novamann (Ontario) Ltd. (Novamann)

AUTHORIZATION:	MONITORING EVENT	SIGNATURE	DATE
	April		
	July		
	October		Sept 26/95

MONITORING PROGRAM DESCRIPTION
- o surface water monitoring Section 1.0
- o leachate level monitoring Section 2.0
- o leachate collection monitoring Section 3.0
- o off-Site groundwater monitoring Section 4.0
- o leachate seep inspection Section 5.0

SPECIAL INSTRUCTION
- o January event:
- o April event:
- o July event:
- **o October event:**

REVISION:	DATE	REVISION
	April 4, 1995	delete off-site groundwater wells HC4-3, HC6-2, HC6-3
	June 13, 1995	review for July monitoring event
	Sept. 25, 1995	review for October monitoring event

1.0 SURFACE WATER MONITORING

1.1 Locations: 12 surface water: SW1-87, SW3-87, SW4-87, SW5-87, SW6-87, SW7-87, SW8-87, SW9-87, SW10-87, SW11-87, SW12-87, SW13-88

sample locations	12
duplicates	1
field Blank	1
Total	14

(additional trip blank for VOCs)

1.2 Monitoring Frequency:

Semiannually: April, after significant rainfall (wet weather sampling) July (dry weather sampling), if July sampling event is dry then surface water samples will be collected in October.

1.3 Types of Monitoring

1. measure flow rate accurately at each location using flow meter and record as L/sec or gpm

2. sampling:

VOCs	see Table A.1
General Chemistry	field pH, field conductivity, alkalinity, chloride, sulfate, TKN, ammonia-N, phenols
Bacteria	total coliforms, fecal coliforms, fecal streptococci, E. Coli coliforms

3. laboratory detection limit for ammonia must be less than 0.02 mg/L

2.0 LEACHATE WELL MONITORING

2.1 Location: 6 Leachate Wells LW1, LW2, LW3, LW4, LW5, LW6

2.2 Monitoring Frequency:

Twice per year: April and July

2.3 Types of Monitoring

1. measure depth with plopper (sound) of each leachate well
2. monitor leachate level in each well

3.0 LEACHATE COLLECTION SYSTEM MONITORING

3.1 Location: 2 Manholes MH15 and MH14

Sample location	1 (MH15 only)
Field blank	1
(additional trip blank for VOCs in October only)	

3.2 Monitoring Frequency:

Two times per year for leachate quality at MH15: **April and October**

3.3 Types of Monitoring

1. Sampling (at MH15):

General chemistry	see Table A.1, includes Field pH and Field Conductivity
Metals & Cyanide	see Table A.1
VOCs	see Table A.1
BNAEs	see Table A.1
Pesticides & PCBs	see Table A.1

NOTE: Attached parameter list (Table A.1) must be followed with no omissions.

4.0 OFF-SITE GROUNDWATER MONITORING

4.1 APRIL - WET WEATHER MONITORING EVENT

4.1.1 Locations:

8 Groundwater	PW1, PW3, HC4-2, HC4-4, HC7-1, HC7-2 HC9-2, HC9-3

General chemistry	
Sample locations	8
Duplicates	2 (one each of PW series and HC series)
Field Blank	1
Total	11
VOCs	
Sample locations	2 (PW1, PW3)
Duplicate	1
Total	3

4.1.2 Monitoring Frequency:

APRIL, after significant rainfall

4.1.3 Types of Monitoring

1. measure well depth and water level at each well

2. pump PW1 and PW3 for a minimum of 5 (five) hours (keck pump or well wizard purge pump may be used)

- sample PW1 and PW3, after pumping

3. Sampling: General Chemistry field pH, field conductivity, alkalinity, TKN, ammonia-N, chloride

phenol

VOCs see Table A.1 for VOC analyses

4.2 JULY - DRY WEATHER MONITORING EVENT

4.2.1 Locations:

8 Groundwater	PW1, PW3, HC4-2, HC4-4, HC7-1, HC7-2, HC9-2, HC9-3

General chemistry	
Sample locations	8
Duplicates	2 (one each of PW series and HC series)
Field Blank	1
Total	11

VOCs	
Sample locations	6 (2 PW series and 4 HC series wells)
Duplicate	2 (one each of PW series and HC series)
Field Blank	1
Total	9

4.2.2 Monitoring Frequency:

JULY, after significant dry period.

4.2.3 Types of Monitoring

1. measure well depth and water level at each well

2. pump PW1 and PW3 for a minimum of 5 (five) hours (Keck pump or Well Wizard purge pump may be used)
   - sample PW1 and PW3 after pumping for VOCs and general chemistry

3. sample select HC series for VOCs, one well at each HC nest, wells to be sampled will be verified by Peter Hayes prior to monitoring event

4.	Sampling:	General Chemistry	field pH, field conductivity, alkalinity, TKN, ammonia-N, chloride
			phenol
		VOCs	see Table A.1 for VOC analyses

5.0 LEACHATE SEEP INSPECTION

5.1	Locations:	9 Leachate Seeps	LS1, LS2, LS3, LS4, LS5, LS6, LS7, LS8, LS9

5.2 Monitoring Frequency:

Four times per year: January, April, July and October

5.3 Types of Monitoring:

1. Identify and photograph any leachate seep that has re-occured
2. Estimate flow rate at the seep and report as L/sec or gpm
3. Complete leachate seep inspection sheets
4. Report any occurrences of leachate seeps immediately to Peter Hayes or Jo-Anne Ing.

6.0 BOTTLE REQUIREMENTS

Analytical Destination	Samples Analyzed	Test Parameters
a) April		
CAS	30 X 1000 mL	General Chemistry
	30 x 500 ml	Phenols
Mann	15 x bacteria kits	Bacteria
Mann	20 x 2 x 40 ml (+ 2 trip blanks)	VOCs
	2 x 500 ml	metals
	2 x 250 ml	mercury
	2 x 250 ml	cyanide
	2 x 1000 ml	BNAEs
	2 x 1000 ml	Pesticides & PCBs
b) July		
CAS	30 X 1000 mL	General Chemistry
	30 x 500 ml	Phenols
Mann	15 x bacteria kits	Bacteria
Mann	25 x 2 x 40 ml (+ 2 trip blanks)	VOCs
c) October		
CAS	**2 x 1000 ml**	**General Chemistry**
	2 x 500 ml	**Phenols**
Mann	**3 x 2 x 40 ml**	**VOCs**
	2 x 500 ml	**metals**
	2 x 250 ml	**mercury**
	2 x 250 ml	**cyanide**
	2 x 1000 ml	**BNAEs**
	2 x 1000 ml	**Pesticides & PCBs**

TABLE A.1
LEACHATE PARAMETER LIST
1995 MONITORING PROGRAM
BAYVIEW LANDFILL SITE

GENERAL CHEMISTRY (CAS)

Hardness	Alkalinity	Fluoride
Chloride	Sulfate	Phosphorous (total)
TKN	Ammonia-N	Phenols

Dear Mr. Skora:

Re: Bayview Park Landfill Site
Leachate Discharge Fees -
Regional Sanitary System
File: 760-4-1

During the period December 28, 1994 to January 27, 1995 inclusive the leachate discharge flows from the closed Bayview Park Landfill Site to the Regional Sanitary Sewer were as follows:

Location	Pump	Pump Hours	Rate (M^3)	Total Flow
Station 2	1		12.560	1,317.54
Station 2	2		12.560	1,031.17
Station 3	1		8.025	1,267.95
Station 3	2		8.025	1,270.35
Collection	(MH 14)		-	13.33
TOTAL				4,900.35

Estimates of flow volumes for the collector located at manhole 14 are based upon an average daily flow of 0.43 cubic metres.

Please direct all invoicing for discharge fees and correspondence to my attention.

Yours truly,

E. Verticchio,
Supervisor of Client Services
and Contract Administration

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

TOTAL COLIFORMS	/100ml	--	--	--	--	--	--

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
–	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

Notes

J	-	The associated value is an estimated quantity.
U	-	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	-	The material was analyzed for, but not detected. The associtated value is an estimate and may be inaccurate or imprecise.
--	-	The parameter was not analyzed.
ND	-	The material was anaylzed, but not detected above the unstated method detection limit.
TR	-	Trace level detection.
<	-	Indicates result less than that shown.
>	-	Indicates result greater than that shown.
R	-	The data was not useable.
NS	-	Insufficient sample.
(a)	-	Indicates units were /50ml rather than that shown.

RE: Bayview Landfill, Burlington, Ontario
Data Validation for Samples Collected April 6, 1995

1.0 Overview

Eighteen water samples were collected on April 6, 1995, from the Bayview Landfill Site in Burlington, Ontario and were submitted to Novamann (Ontario) Ltd. (Novamann) and CRA Analytical Services (CAS) for the analyses summarized in the chart below.

Lab	*Report ID*	*Parameter(s)*	*Field Investigative Samples*	*Field QC Samples*	*Total Number of Samples*
Novamann	951403	Metals[1]	1	1	2
		Total Cyanide	1	1	2
		Bacteria[2]	10	2	11
		Pesticides/PCBs[3]	1	1	2
		BNAEs[4]	1	1	2
		VOCs[5]	14	2	16
CAS	1354-3	General Chemistry I[6]	7	2	9
		General Chemistry II[7]	1	1	2
		General Chemistry III[8]	10	3	13

---

[1] Metals - molybdenum, zinc, lead, bismuth, cadmium, cobalt, nickel, barium, iron, manganese, chromium, vanadium, aluminum, copper, silver titanium, antimony, mercury, selenium, arsenic, tin

[2] Bacteria - faecal coliform, E. coli., fecal streptococcus

[3] Pesticides/PCBs - aldrin, carbaryl, chlordane (alpha and gamma), DDT, diazinon, dieldrin, endrin, heptachlor, heptachlor epoxide, lindane, methoxychlor, methyl parathion, ethyl parathion, toxaphene, PCBs

[4] BNAEs (base/neutral/acid extractables) - bis(2-ethylhexyl)phthalate

[5] VOCs (volatile organic compounds) - 1,1-dichloroethane, 1,2-dichloroethane, 1,1,1-trichloroethane, benzene, trichloroethylene, toluene, tetrachloroethylene, ethylbenzene, chlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, m+p-xylenes, o-xylene

[6] General Chemistry I - alkalinity, total kjeldahl nitrogen (TKN), ammonia, chloride, total phenols

[7] General Chemistry II - hardness, alkalinity, fluoride, chloride, sulphate, total phosphorous, TKN, ammonia, total phenols, biochemical oxygen demand (BOD), chemical oxygen demand (COD), total suspended solids (TSS)

[8] General Chemistry III - alkalinity, chloride, sulphate, TKN, ammonia, total phenols

A data validation was conducted based on principles outlined in the references summarized in Attachment A.

2.0 Sample Holding Times

Holding times established by the Ontario Ministry of the Environment and Energy (MOEE) (Reference No. 1, Attachment A) were used to assess the analytical results produced by Novamann and CAS. Table 1 presents the parameter groups, recommended holding times, and references.

All analyses were completed prior to the expiration of their associated holding times; therefore, qualifications were not warranted.

3.0 Laboratory QA/QC

3.1 Laboratory Blanks

Laboratory blanks prepared by Novamann were found to contain less than detectable concentrations of all target analytes; therefore, qualifications were not warranted.

Laboratory blanks prepared by CAS were found to contain less than detectable concentrations of all target analytes with the exception of alkalinity, which was found at a level of 1.6 mg/L. All samples were either above the sample quantitation limit or non-detect; therefore, qualifications were not warranted.

3.2 Laboratory Surrogate/Check Samples

Surrogate compounds were added to samples prior to analysis for Pesticides/PCBs, BNAEs and VOCs. The following chart outlines the surrogates added and their respective control limits.

Parameter	*Surrogate Compound*	*Lower Control Limit (%)*	*Upper Control Limit (%)*
Pesticides/PCBs	azobenzene	40	130
	decachlorobiphenyl	40	130
	2,4,5,6-tetrachloro-m-xylene	40	130
BNAEs	2-fluorobiphenyl	30	115
	2-fluorophenol	25	121
	2,4,6-tribromophenol	19	122
	terphenyl-D_{14}	18	137
	nitrobenzene-D_5	23	120
	phenol-D_5	10	94
VOCs	4-bromofluorobenzene	80	115
	1,2-dichloroethane	85	115
	toluene-D_8	85	115

The reported surrogate recoveries were within laboratory established control limits. It is noted that recoveries for decachlorobiphenyl could not be calculated due to sample dilution.

Qualifications did not arise as a result of surrogate sample recoveries.

Laboratory check samples were analyzed for all parameters by Novamann and CAS and recoveries were found to be within laboratory established control limits with the exception of a low recovery (19%) for diazinon from Novamann. As a result, qualifications were warranted based on check sample recoveries and can be found summarized in Table 2. It is noted that check sample recoveries were not reported for the following PCB aroclors: 1221; 1232; 1242; 1248; 1254; and, 1260.

3.3 Laboratory Duplicates

Laboratory duplicate analysis was performed by CAS only. The relative percent difference[1] was found to be 9% or less for all parameters; therefore qualifications were not necessary.

---

[1] Relative percent difference = RPD = $\left|\frac{X_1 - X_2}{\overline{X}}\right| \times 100$

where X_1 - initial sample result
X_2 - duplicate sample result
$\overline{X}$ - mean of duplicate sample results

4.0 Field QA/QC

4.1 Field Blanks

Field blanks submitted to CAS were found to contain less than detectable concentrations of all target analytes; therefore, qualifications were not warranted.

Field blanks submitted to Novamann were found to contain detectable levels of target analytes. The following chart summarizes the positive detections in the field blanks.

Parameter	*Field Blank #2 -011 (mg/L)*
zinc	0.005
iron	0.013
aluminum	0.071
copper	0.007
antimony	0.002
selenium	0.004
arsenic	0.002
bis(2-ethylhexyl)phthalate	TR (<MDL (2µg/L))

As a result of these positive detections, qualifications were necessary and can be found summarized in Table 2.

4.2 Field Duplicates

Field duplicate analyses performed by CAS resulted in RPD values of 26% or less for all parameters with the exceptions of TKN and ammonia. RPD values of 96% and 194% respectively resulted in qualifications and that can be found summarized in Table 2.

Field duplicate analyses performed by Novamann were only analyzed for VOCs and were found to be non-detect for all analytes; therefore, qualifications were not warranted for field duplicate analyses.

5.0 Summary and Conclusions

Qualifications were recommended based on check sample recoveries, field blank and field duplicate results.

Data provided by Novamann and CAS are acceptable with the specific qualifications summarized in Table 2.

TABLE 1
SUMMARY OF HOLDING TIMES
Bayview Landfill - Project # 1354-30

Parameter	*Recommended Holding Times*	*Exceedance*	*References (Attachment A)*
Alkalinity	14 days	none	1
Chloride	30 days	none	1
TKN	14/30 days	none	1
Ammonia	7/30 days	none	1
Total Phenols	30 days	none	1
Sulphate	30 days	none	1
Hardness	14/30 days	none	1
Fluoride	30 days	none	1
Total Phosphorous	14/30 days	none	1
BOD	4 days	none	1
COD	7/30 days	none	1
TSS	14 days	none	1
Metals	60 days	none	1
Mercury	7 days	none	1
Total Cyanide	7 days	none	1
Bacteria	48 hours	none	1
VOCs	14 days	none	1
Pesticides/PCBs	30 days	none	1
BNAEs	30 days	none	1

Notes:

1. Where two holding times are given the shorter time refers to unpreserved samples and the longer time refers to preserved samples.

TABLE 2
SUMMARY OF QUALIFICATIONS
Bayview Landfill - Project # 1354-30

Lab	*Sample I.D.*	*Location*	*Parameter*	*Sample Result (mg/L)*	*Qualified Result (mg/l)*	*Reference*
Novamann	-010	MH15	diazinon	ND(0.5µg/L)	ND(0.5µg/L)UJ	A (Sec. 3.2)
Novamann	-011	field blank #2	diazinon	ND(0.5µg/L)	ND(0.5µg/L)UJ	A (Sec. 3.2)
Novamann	-010	MH15	aluminum	0.151	0.151U	B (Sec. 4.1)
Novamann	-010	MH15	arsenic	0.004	0.004U	B (Sec. 4.1)
Novamann	-010	MH15	bis(2-ethylhexyl) phthalate	TR(<2µg/L)	TR(<2µg/L)J	B (Sec. 4.1)
CAS	-012/-020	SW8-87	TKN	0.51/1.46	0.51J/1.46J	C (Sec. 4.2)
CAS	-012/-020	SW8-87	ammonia	0.02/1.38	0.02J/1.38J	C (Sec. 4.2)

Notes:

UJ = The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

A = Qualification due to poor check sample recovery.

U = The analyte was analyzed for, but was not detected above the sample quantitation limit.

B = Qualification due to positive detections found in the field blank.

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

C = Qualification due to poor field duplicate RPD values.

RE: Data Validation of Analytical results for Samples obtained July 12, 1995, from the Bayview Landfill Site in Burlington, Ontario

---

1.0 Overview

Eleven groundwater and one surface water sample were collected from the Bayview Landfill Site in Burlington, Ontario on July 11 and 12, 1995. Samples were submitted to Conestoga-Rovers & Associates Analytical Services (CAS) and Novamann (Ontario) International Inc. (Novamann) for the parameters as summarized in the following table.

Laboratory	*Report ID*	*Parameter(s)*	*Field Investigative Samples*	*Field QC Samples*	*Total Number of Samples*
CAS	1354-4	general chemistry[1]	7	2	9
		general chemistry[2]	2	1	3
		total phenols	9	3	12
Novamann	9502655	bacteria[3]	1	0	1
		VOCs[4]	7	3	10

A data validation was conducted on sample analyses based on principles outlined in the references summarized in Attachment A.

2.0 Sample Holding Times

Holding times for water samples established by the Ontario Ministry of the Environment and Energy (MOEE) (Reference No..1, Attachment A) were used to assess the analytical results produced by Novamann and CAS. Table 1 presents the parameter groups, actual holding times, and recommended holding times.

All analyses were completed prior to the expiration of their associated holding times; therefore, qualifications were not warranted.

---

1 General Chemistry - alkalinity, total kjedahl nitrogen (TKN), chloride, ammonia.

2 General Chemistry - general chemistry I plus sulphate.

3 Bacteria - fecal colilform, E.coli, fecal streptococcus, confirmed coliform.

4 VOCs - ethylbenzene, 1,1,1-trichloroethane, 1,3-dichlorobenzene, 1,2-dichloroethane, tetrachloroethylene, 1,1-dichloroethane, trichloroethylene, 1,4-dichlorobenzene, benzene, toluene, chlorobenzene, p+m-xylene, o-xylene

3.0 Laboratory QA/QC

3.1 Laboratory Blanks

Laboratory blanks analyzed by Novamann and CAS contained less than detectable concentrations of all analytes, with the exception of alkalinity. A concentration of 1.8 mg/L alkalinity (MDL[5] = 0.01 mg/L) was detected in the CAS laboratory blank, but qualifications were not necessary for associated data.

3.2 Laboratory Duplicates

Laboratory duplicate analyses were performed by CAS for all general chemistry parameters and total phenols. The calculated relative percent difference[6] (RPD) values were found to be 8% or less; therefore, qualifications were not required.

3.3 Laboratory Check Samples

Laboratory check sample analyses were performed by CAS and Novamann for all target analytes and found to be within laboratory established control limits; therefore, no qualifications were necessary.

4.0 Field QA/QC

4.1 Field Blanks

A field blank (sample #012) was analyzed by CAS and Novamann for all analytes. The following table summarizes positive detections in the field blank:

Laboratory	*Parameter*	*Concentration*	*MDL*
Novamann	toluene	2.5 µg/L	0.5 µg/L
CAS	alkalinity	5.0 µg/L	1.0 µg/L
	ammonia	0.01 µg/L	0.01 µg/L

Qualifications based on field blanks were warranted for toluene and ammonia and can be found summarized in Table 2.

4.2 Field Duplicates

Field duplicates were submitted blind and were analyzed by Novamann (for VOCs) and by CAS (for general chemistry and total phenols). The calculated RPD values were 42% or less, with the exception of toluene which had an RPD value of 105%. Based on this

---

5 MDL = Method Detection Limit.

6 Relative percent difference = RPD = $\frac{|X_1 - X_2|}{\overline{X}} \times 100$

where X_1 - initial sample result
X_2 - duplicate sample result
$\overline{X}$ - mean of duplicate sample results

result, qualification of associated data for toluene was necessary and is summarized in Table 2.

5.0 Summary and Conclusions

Qualifications were recommended based on field blank and field duplicate results.

The data provided by Novamann and CAS are acceptable with the specific qualifications summarized in Table 2.

TABLE 1

SUMMARY OF HOLDING TIMES

Bayview Landfill Site, Project No. 1354-30

Parameter	*Recommended Holding Times*	*Actual Holding Times*	*Exceedance*	*Reference (Attachment A)*
Bacteria	24 hours	24 hours	none	1
VOCs	14 days	8 days	none	1
Alkalinity	14 days	14 days	none	1
Chloride	30 days	5 days	none	1
Sulphate	30 days	3 days	none	1
TKN	14 days	7 days	none	1
Ammonia	7 days	2 days	none	1
Total phenols	30 days	1 day	none	1

Notes:

1. Bacteria - confirmed coliform, fecal coliform, E.coli, fecal streptococcus.

TABLE 2

SUMMARY OF QUALIFICATIONS

Bayview Landfill Site, Project No. 1354-30

Sample I.D.	*Location*	*Parameter*	*Sample Result (mg/L)*	*Qualified Result (mg/l)*	*Reference*
001	PW1	toluene	1.6	1.6 J	A (Sec. 4.2)

RE: Data Validation of Analytical results for Samples obtained October 19, 1995, from the Bayview Landfill Site in Burlington, Ontario

---

1.0 Overview

Two leachate samples were collected from the Bayview Landfill Site on October 19, 1995. Samples were submitted to Conestoga-Rovers & Associates Analytical Services (CAS) and Novamann (Ontario) International Inc. (Novamann) for analyses as summarized in the following table.

Laboratory	*Report ID*	*Parameter(s)*	*Field Investigative Samples*	*Field QC Samples*	*Total Number of Samples*
CAS	1354-1	general chemistry[1]	1	1	2
		total phenols	1	1	2
Novamann	9504299	metals[2]	1	1	2
		BNAE[3]	1	1	2
		OC Pesticides[4]	1	1	2
		OP Pesticides/PCBs[5]	1	1	2
		VOCs[6]	1	1	2
		total cyanide	1	1	2

A data validation was conducted on sample analyses based on principles outlined in the references summarized in Attachment A.

2.0 Sample Holding Times

Holding times for water samples established by the Ontario Ministry of the Environment and Energy (MOEE) (Reference No. 1, Attachment A) were used to assess

---

1 General Chemistry - chloride, sulphate, fluoride, total kjeldahl nitrogen (TKN), total phosphorous, hardness, alkalinity, ammonia, total suspended solids (TSS), biological oxygen demand (BOD), chemical oxygen demand.

2 Metals - arsenic, antinomy, selenium, mercury, aluminum, chromium, cobalt, copper, iron, lead, manganese, molybdenum, nickel, silver, tin, titanium, vanadium, zinc, barium, bismuth, cadmium.

3 Base Neutral Acid Extractables - bis(2-ethylhexyl)phthalate.

4 Organochlorine Pesticides/Polychlorinated biphenyls-o,p-DDT, aldrin, a-chlordane, dieldrin, endrin, g-BHC (Lindane), g-chlordane, heptachlor, heptacholor epoxide, methoxychlor, Aroclor 1016, Aroclor 1221, Aroclor 1232, Aroclor 1242, Aroclor 1248, Arolor 1254, Aroclor 1260, p,p^1-DDT, toxaphene.

5 Organophosphorus Pesticides - carbaryl, diazinon, ethyl parathion, methyl parathion.

6 VOCs - 1,1-dichloroethane, 1,1,1-trichloroethane, 1,2-dichloroethane, 1,3-dichlorobenzene, 1,4-dichlorobenzene, benzene, chlorobenzene, ethylbenzene, o-xylene, p+m-xylene, tetrachloro-ethylene, toluene, trichloroethylene.

the analytical results produced by Novamann and CAS. Table 1 presents the parameter groups, actual holding times, and recommended holding times.

All analyses with the exception of mercury and cyanide, were completed prior to the expiration of their associated holding times. Mercury analyses exceeded their associated holding times by six days and cyanide analyses exceeded their holding time by four days. As a result qualifications were recommended and are summarized in Table 2.

3.0 Laboratory QA/QC

3.1 Laboratory Blanks

Laboratory blanks analyzed by Novamann and CAS contained less than detectable concentrations of all analytes, with the exception of alkalinity. A positive detection of 1.6 mg/L alkalinity (MDL[7] = 1.0 mg/L) was found in the laboratory blank but no qualifications of associated data were warranted.

3.2 Laboratory Duplicates

Laboratory duplicate analyses were performed for all general chemistry parameters and total phenols by CAS. Calculated relative percent difference[8] (RPD) values were found to be 10% or less; therefore, qualifications were not required.

3.3 Laboratory Check Samples

Laboratory check sample analyses were reported by CAS and Novamann and found to be within laboratory established control limits for all target analytes, with the exception of Heptachlor, an OC pesticide. Heptachlor had a recovery of 25% which was below the control limits of 34-111%. Qualification of associated data was, therefore, required and can be found summarized in Table 2.

4.0 Field QA/QC

4.1 Field Blanks

A field blank (sample #002) was submitted blind and was analyzed by Novamann and CAS for all analytes. The following table summarizes positive detections in the field blank:

---

7 MDL = Method Detection Limit.

8 Relative percent difference = RPD = $\frac{|X_1 - X_2|}{\overline{X}} \times 100$

where X_1 - initial sample result
X_2 - duplicate sample result
$\overline{X}$ - mean of duplicate sample results

Laboratory	*Parameter*	*Concentration (mg/L)*	*MDL (mg/L)*
Novamann	copper	0.004	0.003
	manganese	0.002	0.001
	iron	0.010	0.005
	aluminum	0.034	0.025
	selenium	0.003	0.002
	1,4-dichlorobenzene	2.1 µg/L	1 µg/L
	chlorobenzene	4.4 µg/L	0.5 µg/L
	ethylbenzene	1.6 µg/L	0.5 µg/L
	o-xylene	5.2 µg/L	0.5 µg/L
	p+m-xylene	9.9 µg/L	0.5 µg/L
CAS	alkalinity	1.6	1.0

As a result, qualifications based on field blanks were warranted and can be found summarized in Table 2.

4.2 Field Duplicates

Field duplicates were not submitted for analyses, therefore assessment of data was not performed on this basis.

5.0 Summary and Conclusions

Qualifications were recommended based on holding time exceedences for cyanide and mercury laboratory check sample recoveries and field blank results.

The data provided by Novamann and CAS are acceptable with the specific qualifications summarized in Table 2.

TABLE 1

SUMMARY OF HOLDING TIMES

RE: **Data Validation of Analytical results for Samples obtained November 7, 1995, from the Bayview Landfill Site, Ontario**

1.0 Overview

Twelve surface water samples were collected from the Bayview Landfill Site on November 7, 1995. Samples were submitted to Conestoga-Rovers and Associates Analytical Services (CAS) and Novamann (Ontario) International Inc. (Novamann) for the parameters summarized in the following table.

Laboratory	*Report ID*	*Parameter(s)*	*Field Investigative Samples*	*Field QC Samples*	*Total Number of Samples*
Novamann	9504611	bacteria[1]	10	2	12
		VOCs[2]	10	2	12
CAS		general chemistry[3]	10	2	12
		total phenols	10	2	12

A data validation was conducted on sample analyses based on principles outlined in the references summarized in Attachment A.

2.0 Sample Holding Times

Holding times for water samples established by the Ontario Ministry of the Environment and Energy (MOEE) (Reference No. 1, Attachment A) were used to assess the analytical results produced by Novamann and CAS. Table 1 presents the parameter groups, actual holding times, and recommended holding times.

All analyses were completed prior to the expiration of their associated holding times, with the exception of bacteria. Bacteria analyses exceeded established holding times, therefore, qualifications were required and can be found summarized in Table 2.

---

1 Bacteria - fecal coliform, E.coli, fecal streptococcus, confirmed coliform.

2 VOCs - ethylbenzene, 1,1,1-trichloroethane, 1,3-dichlorobenzene, 1,2-dichloroethane, tetrachloroethylene, 1,1-dichloroethane, trichloroethylene, 1,4-dichlorobenzene, benzene, toluene, chlorobenzene, p+m-xylene, o-xylene.

3 General Chemistry - alkalinity, chloride, sulphate, total kjeldahl nitrogen (TKN), ammonia, total phenols.

3.0 Laboratory QA/QC

3.1 Laboratory Blanks

Laboratory blanks analyzed by CAS contained less than detectable concentrations of all analytes, with the exception of alkalinity. A positive detection of 1.3 mg/L alkalinity (MDL[4] = 1.0 mg/L) was found in the laboratory blank; therefore, requiring qualification of associated data, as summarized in Table 2.

Novamann analyzed a laboratory blank for all target VOC analytes and found no detectable concentrations. As a result, qualifications were not required.

3.2 Laboratory Duplicates

Laboratory duplicate analyses were performed by CAS and Novamann for all general chemistry parameters, total phenols and VOCs. Calculated relative percent difference[5] (RPD) values were found to be 32% or less; therefore qualifications were not required.

3.3 Laboratory Check Samples

Laboratory check sample analyses were performed by CAS and Novamann for all target parameters. Results were found to be within laboratory established control limits for all analytes, with the exception of alkalinity, which had a recovery of 10% which is below laboratory established control limits of 85-112%. Qualifications were necessary and can be found summarized in Table 2.

4.0 Field QA/QC

4.1 Field Blanks

A field blank (sample #005) was submitted blind and was analyzed by CAS and Novamann for all analytes. A positive detection of 1.3 mg/L alkalinity (MDL = 1.0 mg/L) was detected in the field blank, but did not result in qualification.

4.2 Field Duplicates

Field duplicates were analyzed for general chemistry, total phenols, and VOCs. The RPD values for field duplicate analyses performed on surface water samples #012 and #013 were calculated to be 12% or less; therefore, qualifications were not necessary.

---

4 MDL = Method Detection Limit.

5 Relative percent difference = RPD = $\frac{|X_1 - X_2|}{\overline{X}} \times 100$

where X_1 - initial sample result
X_2 - duplicate sample result
$\overline{X}$ - mean of duplicate sample results

5.0 Summary and Conclusions

Qualifications were recommended based on sample holding time exceedance, laboratory blank and laboratory check sample results.

The data provided by Novamann & CAS are acceptable with the specific qualifications summarized in Table 2.

Notes:

A = Qualification due to laboratory check sample recovery.
U = The material was analyzed for, but was not detected above the sample quantitation limit.
B = Qualification due to sample holding time exceedance.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

APPENDIX I

1996 MONITORING PROGRAM

CONESTOGA-ROVERS & ASSOCIATES
1996 SITE MONITORING SPECIFICATIONS

PROJECT: Bayview Park Landfill Site

PROJECT NO.: 1354-30

PROJECT MANAGER: Peter Hayes

PROJECT COORDINATOR: Jo-Anne Ing

MONITORING STAFF:	RESPONSIBILITY
Roger Waller	Field Technician
Dan Daum	Field Technician
Jennifer Stoner	Coordinator/Chemist QA/QC

LABORATORY USED: CRA Analytical Services (CAS), Novamann (Ontario) Ltd. (Novamann)

AUTHORIZATION:	MONITORING EVENT	SIGNATURE	DATE
	March		Feb 27/96
	July		
	October		

MONITORING PROGRAM DESCRIPTION
- o surface water monitoring Section 1.0
- o leachate level monitoring Section 2.0
- o leachate collection monitoring Section 3.0
- o off-Site groundwater monitoring Section 4.0
- o leachate seep inspection Section 5.0
- o landfill gas monitoring Section 6.0

SPECIAL INSTRUCTION
- o **March event: New Program**
- o July event:
- o October event:

REVISION:	DATE	REVISION
	February, 1996	revise monitoring specifications to be consistent with Environmental Performance Report

1.0 SURFACE WATER MONITORING

1.1 Locations: 8 surface water:

Upstream:	SW9A-93, SW11-87
Landfill Vicinity:	SW1-87, SW3-87, SW5-87
Downstream:	SW13-93, SW14-93, SW15-93

sample locations	9
duplicates	1
field Blank	1
Total	11

(additional trip blank for VOCs)

1.2 Monitoring Frequency:

Semiannually: March, after significant rainfall (wet weather sampling) July (dry weather sampling), if July sampling event is dry then surface water samples will be collected in October.

1.3 Types of Monitoring

1. measure flow rate accurately at SW9A-93, SW13-93, SW14-93 and SW15-93 locations using flow meter and record as L/sec or gpm

2. sampling:

VOCs	see Table A.1
General Chemistry	field pH, field conductivity, field temperature, alkalinity, chloride, sodium, potassium, TKN, ammonia-N,
	if phenols are detected in the leachate during two consecutive events, then phenols are to added
Bacteria	total coliforms, fecal coliforms, fecal streptococci, E. Coli coliforms

3. laboratory detection limit for ammonia must be less than 0.02 mg/L

2.0 LEACHATE WELL MONITORING

2.1 Location: 6 Leachate Wells LW1, LW2, LW3, LW4, LW5, LW6

2.2 Monitoring Frequency:

Twice per year: **March** and July

2.3 Types of Monitoring

1. measure depth with plopper (sound) of each leachate well
2. monitor leachate level in each well

3.0 LEACHATE COLLECTION SYSTEM MONITORING

3.1 Location: 1 Manhole MH15

Sample location	1
Field blank	1

(additional trip blank for VOCs in October only)

3.2 Monitoring Frequency:

Once per year for leachate quality at MH15: **March**

3.3 Types of Monitoring

1. Sampling (at MH15):

General chemistry	see Table A.1, includes field pH, field conductivity, field temperature
Metals & Cyanide	see Table A.1
VOCs	see Table A.1
BNAEs	see Table A.1
Pesticides & PCBs	see Table A.1

NOTE: Attached parameter list (Table A.1) must be followed with no omissions.

4.0 OFF-SITE GROUNDWATER MONITORING

4.1.1 Locations:

7 buffer zone observation wells:
PW3, OW1A-93, OW1B-93, OW2A-93, OW2B-93, OW3-93, OW4-93

4.2 Monitoring Frequency:

Semiannually: **March** and July

4.3 Types of Monitoring

1. measure well depth and water level at each well.
2. all observation well locations purged at least 10 well casing volumes or dry prior to sampling.

   -sample PW3, OW1B-93, OW2A-93, OW2B-93, OW3-93 AND OW4-93, after purging, for both VOCs and general chemistry

3. sampling: VOCs — see Table A.1 (above six locations)

   General Chemistry — field pH, field conductivity, alkalinity, TKN, ammonia-N, chloride, sodium, potassium

5.0 LEACHATE SEEP INSPECTION

5.1 Locations: 9 Leachate Seeps — LS1, LS2, LS3, LS4, LS5, LS6, LS7, LS8, LS9

5.2 Monitoring Frequency:

Twice per year: **March** and July

5.3 Types of Monitoring:

1. Identify and photograph any leachate seep that has re-occured
2. Estimate flow rate at the seep and report as L/sec or gpm
3. Complete leachate seep inspection sheets
4. Report any occurrences of leachate seeps or failure of leachate collection system immediately to Peter Hayes or Jo-Anne Ing.
5. It is noted that regular leachate inspections will also be conducted by City of Burlington staff. These reports will be documented and discussed in the annual monitoring report.

6.0 LANDFILL GAS MONITORING

6.1 Locations: GP1-93, GP2-93 AND GP3-93

6.1.1 Monitoring Frequency:

Twice per year: **March and July**

6.1.2 Types of Monitoring

Measure and record gas levels. If groundwater is present within gas probes purge and then record groundwater level prior to recording gas levels the next day.

6.0 BOTTLE REQUIREMENTS

Analytical Destination	Samples Analyzed	Test Parameters
a) March		
CAS	**20 X 1000 mL**	**General Chemistry**
	20 x 500 ml	**Phenols**
Mann	**2 x 15 x bacteria kits**	**Bacteria**
Mann	**20 x 3 x 40 ml (+ 2 trip blanks)**	**VOCs**
	2 x 500 ml	**metals**
	2 x 250 ml	**mercury**
	2 x 250 ml	**cyanide**
	2 x 1000 ml	**BNAEs**
	2 x 1000 ml	**Pesticides & PCBs**

b) July

CAS	17 X 1000 mL 17 x 500 ml	General Chemistry Phenols
Mann	15 x bacteria kits	Bacteria
Mann	20 x 3 x 40 ml (+ 2 trip blanks)	VOCs

c) October

CAS	2 x 1000 ml 2 x 500 ml	General Chemistry Phenols
Mann	3 x 3 x 40 ml 2 x 500 ml 2 x 250 ml 2 x 250 ml 2 x 1000 ml 2 x 1000 ml	VOCs metals mercury cyanide BNAEs Pesticides & PCBs

TABLE A.1
LEACHATE PARAMETER LIST
1995 MONITORING PROGRAM
BAYVIEW LANDFILL SITE

GENERAL CHEMISTRY (CAS)

Hardness	Alkalinity	Fluoride
Chloride	Sulfate	Phosphorous (total)
TKN	Ammonia-N	Phenols
BOD	COD	Suspended Solids

METALS & CYANIDE (Novamann)

Aluminum (total)	Antimony (total)	Arsenic (total)
Barium (total)	Bismuth (total)	Cadmium (total)
Chromium (total)	Cobalt (total)	Copper (total)
Iron (total)	Lead (total)	Manganese (total)
Mercury (total)	Molybdenum (total)	Nickel (total)
Selenium (total)	Silver (total)	Tin (total)
Titanium (total)	Vanadium (total)	Zinc (total)
Cyanide (total)	Sodium (total)	Potassium (total)

VOCs (Novamann)

EPA 624 List + xylenes

BNAEs (Novamann)

bis(2-ethylhexyl)Phthalate

Oil and Grease (Novamann)

mineral oil and grease
animal/vegetable oil and grease

Appendix G

Aerial Photo Summary

Year	Source	Notes
1934	NAPL	The north and northwest portion of the Site consisted of inferred residential dwellings, barn structures, and inferred orchards in the north portion, with driveways leading from present-day Upper Middle Road. A creek was observed along the southwest portion of the Site and forested areas were observed along the southwest boundary of the Site. The remainder of the Site appeared to consist of agricultural row crops. A road similar in location to present-day Upper Middle Road was observed to the northwest of the Site, followed by agricultural land. A road similar in location to present-day Burloak Drive was observed northeast of the Site, followed by agricultural land. Agricultural land was observed on the surrounding properties to the southwest and southeast.
1954	NAPL	The Site and surrounding properties appeared similar to 1934. Additional inferred orchards were observed off-site to the northwest of present-day Upper Middle Road.
1965	NAPL	The Site and surrounding properties appeared similar to 1954.
1979	NAPL	The Site appeared similar to 1965. The surrounding properties to the northwest, southwest and southeast appeared similar to 1965. Additional roadways were observed on the surrounding properties to the northeast, in the vicinity of present-day Bronte Creek Provincial Park.
1999	Oakville	The residential dwelling and barn structures located in the north portion of the Site appear to have been demolished. A residential dwelling and barn structures were observed in the northwest portion of the Site. The inferred orchards either appeared treed or were no longer observed. The majority of the Phase One Property consisted of agricultural land, with forested land located along the southeast boundary and Sheldon Creek along the southwest boundary. A road similar in location to present-day Mainway was present southeast of the Site, followed by inferred commercial and industrial buildings along Mainway, Heine Court, Sutton Drive and John Lucas Drive. Residential dwellings under construction were observed to the southwest of Sheldon Creek and northwest of Upper Middle Road.
2010	SWOOP	The residential dwelling and barn structures in the northwest portion of the Site appear to have been demolished. The majority of the Phase One Property consists of agricultural land, with forested land located along the southeast boundary and Sheldon Creek along the southwest boundary.

		Inferred residential dwellings and apartment buildings have been constructed to the northwest of Upper Middle Road and southwest of Sheldon Creek and appear similar to present-day. Surrounding properties to the northeast appear similar to present-day. Additional commercial and industrial buildings have been constructed along Mainway, Heine Court, Sutton Drive and John Lucas Drive to the southeast of the Site.
2023	Oakville	The Site appeared similar to 2010. The surrounding properties also appeared similar to 2010. Additional commercial and industrial buildings have been constructed along Mainway, Heine Court, Sutton Drive and John Lucas Drive to the southeast of the Site.

Appendix H
Photographs

Photo 1 West corner of Site, 2024-08-19.

Photo 2 Several Environmental Monitoring Wells present throughout the Site (Well Tag #A385927), 2024-08-19.

Photo 3 Stream runs through wooded area in the south section of the Site, 2024-08-19.

Photo 4 Southwest portion of the Site, along Mainway, 2024-08-19.

Photo 5 Various industrial & commercial businesses along Mainway across from the Site, 2024-08-19.

Photo 6 Sheldon Creek Woodlot present in south center of the Site, 2024-08-19.

Photo 7 Small stream runs south through center of the Site, 2024-8-19.

Photo 8 Wooded area located in northwest corner of the Site, 2024-08-19.

Photo 9 Bronte Creek Provincial Park located north of the Site, 2024-08-19.

Photo 10 Several pole mounted transformers located along Burloak Drive and Upper Middle Road, 2024-08-19.

Photo 11 Communications tower located in northwest part of the Site, 2024-08-19.

Photo 12 Enbridge petroleum pipeline runs along Upper Middle Road through the Site, 2024-8-19.

Photo 13 Stormwater/sanitary sewer covers located along Upper Middle Road & Burloak Drive, 2024-8-19.

Photo 14 Stormwater management pond located northwest of the Site across Upper Middle Road, 2024-08-19.

Photo 15 Pad mounted transformers located at 5510 and 5540 Mainway adjacent to the Site, 2024-08-19.

Photo 16 Forested portion of the Site along Mainway, 2024-08-19.

Photo 17 Petro Canada gas station located at the corner of Mainway and Burloak Drive, 2024-08-19.

Photo 18 Underground AST's present at gas station (50-100m east of subject site), 2024-08-19.
