Executive Summary

Content

Paradigm Transportation Solutions Limited (Paradigm) was retained to conduct this Transportation Impact Study (TIS) for the proposed Bronke Creek Meadows subdivision. The site is generally located at the northwest corner of the Mainway and Burloak Drive intersection in the City of Burlington.

The study aims to assess current traffic and the additional traffic generated by the proposed Phase 1 of the development, analyze the traffic impact on the adjacent roadway network and provide the municipality and owner with any improvements required to mitigate the identified effects of the site-generated traffic.

The property owner proposes to develop the lands as a mixed-use subdivision with employment, institutional, retail, and a variety of low, medium, and high-density residential along with park and open space.

The Phase 1 development plan includes approximately 697 residential units (comprised of single detached, townhomes, and apartment units), approximately 743 m^2 (8,000 sq. ft) of retail space, and 71,164 m^2 (766,000 sq. ft) of institutional space. These development statistics are approximate and assume a conservative estimate for the land use densities.

Vehicle access to Phase 1 is proposed via new municipal roads to Upper Middle Road and Mainway. Build-out of Phase 1 is anticipated to occur by Year 2035; timing subject to market conditions.

The assumed internal network is subject to change, but development density targets and access points are likely to remain unchanged. This study focuses on Phase 1 of the subject site and examines long-term transportation network impacts and potential mitigation measures to support future background and site generated traffic.

The full build-out is anticipated to be completed in a horizon beyond Year 2045 (10 years after Phase 1 Build-Out), at an unknown time.

Although the development application is for the Phase 1 lands only, to provide a high-level long-range assessment of the potential road improvements required to accommodate the possible development, a Full Build-Out scenario is also assessed.

The Full Build-Out stats are based on high-level assumptions of development densities, community needs, and are subject to change.

The Full Build-Out envisions residential (single detached, townhomes, and apartment units), commercial/retail/office, community space, and an elementary school.

As the development application progresses, updates to the TIS may be required to reflect changes and phasing of the concept plan.

Conclusions

The proposed Phase 1 development will generate approximately 934 new vehicle trips during the weekday AM peak hour, 960 new vehicle trips during the weekday PM peak hour, and 631 new vehicle trips during the Saturday peak hour

Detailed traffic analysis was conducted for each of the study area intersections under Base (2024), 2035, 2040, and 2045 traffic conditions. The capacity analysis showed that deficiencies currently exist and are projected to occur at certain locations within the study area with anticipated growth in traffic, including the proposed development.

Increasing the intersection capacity through additional through lanes or dedicated turn lanes may not be feasible or desirable for an active transportation-friendly roadway cross-section. If capacity of the intersection cannot be increased, then the demand (traffic volume) will need to be decreased through TDM and alternative modes of transportation.

The following capacity constraints at the study area intersections are identified.

Appleby Line at Dundas Street

Horizon Year	Operations
2024 Base Year	Approaching Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

During the Base Year, several movements are approaching capacity during the peak hours. Under the future Background horizon, several movements are forecast to experience critical movements including the westbound left-turn lane as well as the northbound through.

With the addition to site generated traffic, the projected critical movements are expected to worsen under the future Total horizons and near-capacity movements such as the northbound left and southbound through, are forecast to have v/c ratios above the critical thresholds.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Despite applying these mitigation measures, several movements are still projected to exceed capacity with a v/c ratio exceeding 1.00 and operate with LOS F, primarily due to high traffic volumes along Appleby Line and Dundas Street.

Appleby Line at Upper Middle Road

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are present in the Base Year operations for several movements including the eastbound left, eastbound through-right, westbound through, westbound right, southbound through-right, and southbound left-turn lanes throughout the weekday and Saturday peak hours, operating at LOS C-E and queues exceeding storage at the left-turn lanes. It is forecast that these movements will further deteriorate under the future Background and Total conditions, ultimately operating at LOS E-F with v/c ratios greater than 1.00 during the weekday and Saturday peak hours.

To accommodate projected traffic volumes, double westbound left and southbound left-turn lanes were added with protected phasing and the existing traffic signal cycle times were adjusted.

With the implementation of these mitigation measures, delays are expected to be reduced by over 280 seconds for the eastbound approach, westbound approach, northbound approach, and the southbound left-turn lane during the weekday and Saturday peak hours. Despite these reductions, several of the movements are still projected to exceed capacity with a v/c ratio exceeding 1.00, as well as queues exceeding the available storage at exclusive turn lanes

primarily due to high traffic volumes along Appleby Line and Upper Middle Road.

Upper Middle Road at West School Driveway/Private Driveway

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Within Capacity
2035 Total	Within Capacity
2040 Background	Within Capacity
2040 Total	Within Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

It is anticipated that under the Background conditions, critical movement is noted in the 2045 Background horizon in the northbound through-left lane operating at LOS E with a v/c ratio of 0.85 during the weekday AM peak hour.

Under the 2045 Total horizon, the eastbound through-right lane is forecast to worsen, operating at LOS D with a v/c ratio greater than 0.85 during the weekday AM peak hour.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted, in addition to the widening of Upper Middle Road.

With these mitigation measures, under the 2045 future Total horizon, the northbound through-left lane can see a reduction in delays by 51 seconds, with a v/c ratio less than 0.70 during the weekday AM peak hour. However, the eastbound through-right lane is still projected to be a critical movement as the v/c ratio exceeds 0.85, primarily due to high traffic volumes along Upper Middle Road.

Upper Middle Road at East School Driveway

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Currently, the northbound left-turn lane operates at LOS F and LOS D during the weekday AM and PM peak hours respectively. All other lanes operate at acceptable conditions at LOS B or better.

Under Background conditions, the westbound left-turn lane 95th percentile queues are forecast to exceed the available storage.

The addition of site-generated traffic is forecast to significantly increase delays for the northbound left-turn movement due to the lack of capacity from background traffic growth.

Upper Middle Road at Quinte Street

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under existing conditions, critical movement is observed in the southbound left-turn lane, operating at LOS F with a v/c ratio greater than 1.00 during the weekday AM peak hour.

Under the Background conditions, the operations of the southbound left-turn lane are forecast to worsen during the weekday PM and Saturday peak hours, operating at LOS D-E.

Under future Total conditions, during the weekday AM peak hours, the northbound approach is forecast to degrade to LOS F with critical delays and v/c ratios significantly exceeding 1.00.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Signalize the intersection (OTM Warrants Not Satisfied – Signalization recommended based on operational considerations);
- Separate eastbound left-turn lane; and
- Separate left-turn lanes for the northbound and southbound approaches with protected-permissive left-turn phases.

With these mitigation measures, a significant reduction in delays in the northbound and southbound movements are noted during the weekday and Saturday peak hours, improving to LOS C or better, with v/c ratios less than 0.30. Critical movement is note in the westbound approach with delays in the LOS D-E range during the weekday and Saturday peak hours with a v/c ratio over 0.95 due to high traffic volumes along Upper Middle Road.

Upper Middle Road at Sutton Drive

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movement is noted in the westbound through-right lane during the weekday PM peak operating at LOS C with a v/c ratio of 0.85.

By the 2035 Background horizon, the intersection is projected to experience critical movements including the eastbound left-turn lane (LOS F, v/c > 1.00) with queues exceeding storage by up to 35 m, and the southbound approach (LOS E, v/c > 1.00) during weekday peak hours.

It is anticipated that during the future Total horizon, the westbound approach will degrade to LOS F with a v/c ratio over 1.00 during the weekday AM and Saturday peak hours, as well as in the southbound approach during the weekday PM and Saturday peak hours.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Double southbound left-turn lanes;
- Northbound left-turn lane and protected-permissive phase;
- Westbound left-turn lane and protected-permissive phase; and
- Optimizing the timing of traffic signals.

Despite this, the eastbound and southbound left-turn lanes are expected to continue to experience queues greater than the available storage. The westbound through-right lane is still expected to operate

with a v/c ratio exceeding 0.85 during the weekday PM peak hour, due to high traffic volumes along Upper Middle Road.

Upper Middle Road at Baker Drive

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Within Capacity
2035 Total	Within Capacity
2040 Background	Within Capacity
2040 Total	Within Capacity
2045 Background	Within Capacity
2045 Total	Within Capacity

Individual movements at the intersection of Upper Middle Road at Baker Drive presently operate at LOS C or better during the weekday peak hours. Similar levels of operation are expected under future Background and Total conditions with only a minor increase in delay resulting from background traffic growth

Upper Middle Road at Deer Place

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At Upper Middle Road at Deer Place, movements during the weekday peak hour currently operate at acceptable conditions, with the exception being the southbound approach, operating at LOS D during the weekday PM peak hour.

Under the 2045 Background horizon, the southbound approach is forecast to degrade to LOS D during the weekday AM peak hour with a minor increase in delays from background traffic growth.

Total conditions operate similar to background with only a minor increase in delay resulting from site traffic.

Upper Middle Road at Blue Spruce Avenue

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under existing conditions, the southbound approach operates at LOS D-F range during the weekday AM/PM and Saturday peak hours. Operations are projected to further degrade with Background traffic growth. Under Background conditions, the eastbound left-turn lane is expected to degrade to LOS D during the weekday PM peak hour. The southbound approach is also forecast to further degrade to LOS F during the weekday and Saturday peak hours with v/c ratios exceeding 1.00 due to increased delays from eastbound/westbound traffic growth along Upper Middle Road.

Total conditions operate similar to background with only a minor increase in delay resulting from site traffic.

Adjustments to the roadway geometry should be considered to accommodate projected background traffic volumes. Some possible upgrades include implementing the following:

- Signalize the intersection (OTM Warrants Not Satisfied – Signalization recommended based on operational considerations).

These adjustments are forecast to improve the operation of the southbound movement during the weekday and Saturday peak hours, operating at LOS B or better with Delays projected to be less than 20 seconds. In addition to delay reduction, signalization of this intersection provides a controlled crossing for pedestrians and cyclists.

Burloak Drive at Bronte Creek Park Access

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under existing conditions, the westbound approach currently operates at LOS F during the weekday PM peak hour, with delays of less than 70 seconds.

Performance expected to further deteriorate under future Background scenarios due to background growth. Under Background conditions, this movement is also projected to degrade to LOS F during the Saturday peak hour. Additionally, during the weekday PM peak hour, the southbound left-turn movement is forecast to decline to LOS D.

Total conditions operate similar to background with only a minor increase in delay resulting from site traffic.

Adjustments to the roadway geometry should be considered to accommodate projected background traffic volumes. Some possible upgrades include implementing the following:

- Signalize the intersection (OTM Warrants Not Satisfied – Signalization recommended based on operational considerations).

These adjustments are forecast to improve the operation of this intersection, with all movements operating at LOS C or better, with delays less than 30 seconds during the weekday and Saturday peak hours. The westbound approach during the weekday PM peak hour will see the largest reduction in delays, with delays at 28 seconds and v/c ratio of less than 0.45.

A traffic signal is also expected to improve pedestrian and cycling safety by providing a control crossing of Burloak Drive.

Burloak Drive at Mainway

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under Background conditions, the northbound left-turn lane degrades to a LOS F with a v/c ratio exceeding 1.00 during the weekday AM and PM peak hours, with queue lengths exceeding the available storage by less than 80 m and 140 m respectively. The eastbound right-turn lane is also projected to experience critical delays at LOS F and v/c ratio grater than 0.95 during the weekday AM peak hour.

Under the future Total horizon, the eastbound right-turn lane is also anticipated to operate in the LOS F range with a v/c ratio exceeding 1.00 and significant delays resulting from site-generated traffic, during the weekday PM peak hour.

Adjustments to the roadway geometry are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Optimize signal cycle times of the existing traffic signals; and
- Double northbound-left turn lanes with protected phase.

Traffic signal adjustments and implementing double northbound left-turn lanes is forecast to improve operations of the eastbound and northbound approaches during the weekday and Saturday peak hours. However, the northbound left-turn lane will still exceed the available storage by approximately 40 m due to the high traffic volumes along Burloak Drive and Mainway.

It is noted that double northbound left-turn lanes may not be feasible as the intersection may already be at the ultimate cross-section width with the widening of Burloak Drive. In addition, adding lanes may not be desirable as increasing roadway width can have negative impacts to pedestrian and cycling environments.

To avoid such area intense mitigation measures, the reduction of future growth and single occupant vehicles is required. An increased modal split will need to be considered to decrease the number of single

person vehicle trips, which the site will also support through TDM measures to improve active transportation and accessibility.

Mainway at Sutton Drive

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under Background conditions, the northbound approach will likely operate in the LOS E range and degrade under future horizons with background traffic.

Under future Total conditions, critical movements are forecast in the northbound and southbound approaches during the weekday and Saturday peak hours and, operating at LOS F with a v/c ratio greater than 1.00.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Signalizing the intersection (OTM Warrants Satisfied); and
- Eastbound left-turn lane with a protected-permissive phase.

Reconfiguring the lane layout and signalizing the intersection is projected to improve the operations of the intersection. During the weekday and Saturday peak hours, all movements are expected to operate with LOS B or better with v/c ratios less than 0.85, with the exception being the southbound approach during the weekday PM peak hour operating at LOS D with a v/c ratio over 0.85. However, this mitigation measure is still expected to provide a substantial improvement, as the southbound approach improves from excessive delays and a v/c ratio exceeding 3.00 to tolerable conditions. Delays can be attributed to the high traffic volumes along Mainway and site traffic along Sutton Drive.

Mainway at Norjohn Court/Lampman Avenue

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the northbound and southbound approaches during the weekday peak hours, operating at LOS D-E. Under future Background and Total horizons, these movements are projected to degrade to LOS F with significant delays and v/c ratios exceeding 1.00.

To accommodate projected traffic volumes, traffic signals can be implemented to the existing stop-controlled intersection.

- Signalizing the intersection (OTM Warrants Not Satisfied – Signalization recommended based on operational considerations).

The signal warrant analysis indicates traffic control signals are not warranted under the 2045 horizon. Even though the signal criteria have not been met, installing unwarranted traffic control signals would improve operations.

With signalization, northbound and southbound approaches are forecast to have delays reduced by up to 449 seconds during the weekday peak hours.

Additional turn lanes with unsignalized intersection were tested but were not found to reduce the delays. As the delays stem from the high volume of eastbound/westbound traffic, northbound and southbound movements require controlled gaps to complete manoeuvres

Appleby Line at Mainway

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the westbound through-right and northbound left-turn lanes, operating at LOS F with v/c ratios greater than 1.00 during the weekday PM peak hour.

Under Background conditions, the eastbound left is forecast to operate with v/c ratios exceeding 0.95, as well as queues exceeding the available storage for the left-turn lane.

Several movements are forecast to worsen under Total conditions, including the eastbound left, eastbound through-right, westbound left, northbound through-right, southbound left, and southbound through-right lanes throughout the weekday and Saturday peak hours.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Adjusting the signal timings are anticipated to significantly improve operations for all movements by reducing delays during the weekday AM peak hour. Although, critical movements are still expected in the eastbound left, westbound through-right, northbound left, northbound through-right, and southbound through-right movements due to high traffic volumes, the proposed measures are anticipated to reduce delays by up to 299 seconds during the weekday PM peak hour as well.

Additional measures have been tested, including increasing queue storage. Increasing road capacity by adding travel lanes may not be feasible as the intersection may already be at the ultimate cross-section width with the widening of Appleby Line. In addition, adding lanes may not be desirable as increasing roadway width can have negative impacts to pedestrian and cycling environments. The reduction of future growth and single occupant vehicles is required.

Appleby Line at Corporate Drive

Horizon Year	Operations
2024 Base Year	Within Capacity

2045 Total	Exceeding Capacity

Under the Background conditions, critical movement is projected for the westbound approach, operating at LOS E with a v/c ratio of 0.85 during the weekday PM peak hour, and is expected to worsen under future Total conditions.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Adjusting the signal timings is anticipated to slightly improve operations for the westbound approach by improving the v/c ratio to less than 0.85 during the weekday PM peak hour. Despite these reductions, critical movements are still noted in the westbound and northbound through-right movements during the weekday PM peak hour due to high traffic volumes along Appleby Line.

Burloak Drive at North Service Road

2024 Base Year	Approaching Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under Background conditions, critical movements are forecast in the northbound left-turn lanes during the weekday AM peak hour, operating at LOS F with v/c ratios exceeding 1.00.

With increased traffic volumes in the future Total horizon, the eastbound right-turn lane is forecast to degrade to LOS F with a v/c ratio greater than 1.00 during the weekday PM peak hour and the northbound through lane is anticipated to operate with a v/c ratio of 0.85 during the weekday PM peak hour.

To accommodate projected traffic volumes, double northbound left-turn lanes can be implemented along Burloak Drive.

Adjusting the lane configuration and signal timings are anticipated to improve operations for the northbound left-turn lane during the weekday AM peak hour by reducing delays by up to 164 seconds. During the weekday PM peak hour, delays in the eastbound right-turn lane are expected to improve by up to 153 seconds. However, critical movements are still projected at the intersection due to high traffic volumes along Burloak Drive.

Burloak Drive at QEW Westbound Off-Ramp

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the westbound approach during the weekday and Saturday peak hours, operating at LOS D-F with v/c ratios exceeding 1.00. Delays are projected to worsen with Background traffic growth and site-generated traffic, and the queues are forecast to extend beyond the available storage. The southbound approach is also forecast to operate with a v/c ratio exceeding 1.00 during the weekday PM peak hour.

Under the 2045 Background horizon, the westbound ramp left and right-turn 95th percentile queue lengths are forecast to extend between 325 and 865 m back during the peak hours and are forecast to spill back to the mainline. However, SimTraffic queuing analysis estimates 95th percentile queue lengths are forecast to extend up to 350 m back during the weekday PM peak hour and is not expected to reach the bullnose, located approximately 500 m from the stop bar.

Under Total conditions, the northbound approach will operate with a v/c ratio exceeding 0.85 during the weekday peak hours. The southbound approach is expected to operate with a v/c ratio greater than 0.85 during the weekday peak hours, under the 2045 Total horizon.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Separating the existing westbound left-right turn lane to double left and right turn lanes; and
- Optimizing the timing of traffic signals.

Implementing these measures are forecast to significantly reduce delays during the weekday and Saturday peak hours. Despite the significant delay reductions, capacity issues are still expected. The movements still exceeding capacity includes the westbound approach, northbound, and southbound approaches due to the high traffic volumes along Burloak Drive during the future horizon.

Burloak Drive at QEW Eastbound Off-Ramp/Red Oak Boulevard

2045 Total	Exceeding Capacity

Individual movements at the intersection of Burloak Drive at the QEW Eastbound Off-Ramp presently operate at acceptable conditions, with a LOS D or better for all movements.

Under the Background horizon, the southbound approach is projected to experience with a v/c ratio greater than 0.90 during the weekday PM peak hour.

Under future Total conditions, critical movements are forecast in the eastbound left-turn lane, operating at LOS D range with a v/c ratio over 0.75 during the weekday AM peak hour and Saturday peak hours.

The eastbound left-turn 95th percentile queue length is forecast to extend over up to 105 m back during the weekday AM peak hour. Ramp queues are not expected to reach the bullnose, located approximately 450 m from the stop bar, and are not forecast to spill back to the mainline.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Converting the eastbound through lane to a through-left lane; and

- Optimize the timing of traffic signals.

The adjustments to the lane configuration and signal timings are projected to improve operations during the weekday and Saturday peak hours. The southbound approach is expected to operate with delays reduced by up to 37 seconds. Despite these reductions, critical movements are still anticipated due to high traffic volumes along Burloak Drive.

Appleby Line at North Service Road

Horizon Year	Operations

2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

In the Base Year, a critical movement is observed in the westbound left-turn lane, operating at LOS F with a v/c ratio greater than 0.95 and queues exceeding the available storage during the weekday PM peak hour.

Under Background conditions, critical movements are forecast in the eastbound left, westbound through-right, and northbound approach during the weekday PM peak hours, operating with v/c ratios greater 0.95 and queues exceeding storage for the left-turn lanes.

With increased traffic volumes in the future Total horizon, the northbound and southbound through-right lanes are projected to operate with v/c ratios exceeding 0.85 during the weekday peak hours.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Adjusting the signal timings are anticipated to improve operations for the northbound left-turn and southbound through-right lane by reducing delays by up to 34 seconds. However, critical movements are still projected at the intersection due to high traffic volumes at the intersection.

Appleby Line at QEW Westbound Off-Ramp

2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the westbound right-turn lane during the weekday PM peak hour, operating at LOS F with v/c ratios exceeding 1.00.

Under Background conditions, the northbound approach is also projected to operate with v/c ratios above 0.85 during both weekday peak periods. In the weekday AM peak hour, the westbound right-turn lane is expected to worsen to LOS F with a v/c ratio greater than 1.00. Additionally, during the weekday PM peak hour, the westbound left-turn lane is forecast to degrade to LOS F, with a v/c ratio exceeding 1.00. The westbound left and right-turn 95th percentile queue lengths are forecast to extend between 315 and 865 m back during the weekday PM peak hour and are forecast to spill back to the mainline.

However, SimTraffic queuing analysis estimates 95th percentile queue lengths are forecast to extend up to 350 m back during the peak hours and is not expected to reach the bullnose, located approximately 500 m from the stop bar.

The southbound approach is expected to operate with v/c ratios above 0.90 during the weekday PM peak hour, and above 0.85 during the AM peak hour. Overall, delays are anticipated to worsen under Total conditions with the addition of site-generated traffic.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Double westbound right-turn lanes; and
- Optimize the timing of traffic signals.

Implementing these measures are forecast to significantly reduce delays in the westbound approach and the northbound approach. During the weekday PM peak hour, despite delay reductions of up to 850 seconds in the westbound approach, capacity issues are still

expected. The movements still exceeding capacity includes the westbound left-turn, westbound right-turn, northbound, and southbound approaches due to the high traffic volumes at Appleby Line at QEW Westbound Off-ramp. With the mitigation measures, queuing on the QEW westbound off-ramp is not expected to impact the mainline operations.

Appleby Line at QEW Eastbound Off-Ramp

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Base year scenario show critical operations for the eastbound left-turn off-ramp movement which operates with a v/c of 0.75 during the weekday AM peak hour.

Under Background conditions, the eastbound right-turn lane is forecast to operate with queues exceeding the available storage during the peak hours. The 95th percentile queue is forecast to extend beyond the available storage by less than 55 m and is not expected to reach the bullnose located approximately 415 m away.

Under future Total conditions, the eastbound left-turn lane is forecast to degrade to LOS E with a v/c ratio over 0.95 during the weekday AM peak hour. The eastbound left-turn lane is forecast to have queues exceeding the available storage by less than 15 m during the weekday AM peak hour but is not expected to reach the bullnose located approximately 415 m away.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Implementing these measures are forecast to reduce delays by up to 18 seconds in the eastbound approach during the weekday and Saturday peak hours. During the PM peak hour, delays are reduced by up to 44 seconds in the southbound approach. However, these movements are still projected to operate as critical movements due to high traffic volumes at the intersection.

Although queuing is forecast to extend beyond the available storage, queues are not expected to impact QEW mainline highway operations.

Appleby Line at Harvester Road

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the eastbound left-turn and westbound through-right lane, operating at LOS F with v/c ratios greater than 0.95. The westbound left-turn lane operates at LOS E-F during the weekday PM and Saturday peak hours with a v/c ratio greater than 0.90. The southbound left-turn lane also exhibits queues exceeding the available storage during the weekday AM peak hour. These movements are anticipated to degrade with future traffic growth.

With background traffic growth, critical operations are forecast for the eastbound through-right lane under the 2040 horizon during the weekday PM peak hours, operating at LOS E with a v/c ratio greater than 0.85.

Under the Total conditions, the eastbound left-turn lane will degrade to LOS F with v/c ratios greater than 0.95 during the weekday AM and Saturday peak hours. The northbound and southbound through lanes are also expected to operate with v/c ratios exceeding 0.85 during the weekday AM and PM peak hours respectively.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Double southbound left-turn lanes with a protected phase; and
- Optimize the timing of traffic signals.

Implementing these measures are forecast to significantly reduce delays in the eastbound and in the westbound approach during the weekday and Saturday peak hours. However, the eastbound left, westbound approach, northbound through, northbound right, southbound left and southbound through lanes are still projected to operate as critical movements due to high traffic volumes at the intersection.

Double northbound left-turn lanes may not be feasible and may not be desirable as increasing roadway width can have negative impacts to pedestrian and cycling environments.

Appleby Line at Fairview Street

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are present at the eastbound and southbound right-turn lanes, operating at LOS D and B with 95th percentile queue lengths exceeding the available storage by less than 70 m.

Under future Background conditions, the eastbound left-turn, northbound left-turn and southbound through lanes are forecast to operate as critical movements, at LOS D-F with 95th percentile queues exceeding the storage for left-turning movements, during the weekday peak hours. The southbound left-turn lane will also operate with queues exceeding the storage during the weekday AM peak hour. The northbound through movement is forecast to operate with delays in the LOS D range or worse and a v/c ratio greater than 0.90 during the AM peak hour.

These movements are projected to worsen with the addition of site-generated traffic under Total conditions, deteriorating to LOS D-F.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Despite applying these mitigation measures, several movements are still projected to exceed capacity with a v/c ratio exceeding 1.00, as well as queues exceeding the available storage at exclusive turn lanes primarily due to high traffic volumes along Appleby Line and Fairview Street.

Mainway at Site Access A

Horizon Year	Operations
2035 Total	Within Capacity
2040 Total	Within Capacity
2045 Total	Within Capacity

A new site connection at Mainway and Site Access A is provided to accommodate for additional site generated traffic for the healthcare and institutional development located along Mainway. Individual movements at the intersection of Site Access A at Mainway is expected to operate at acceptable conditions under the future Total conditions, with a LOS C or better for all movements.

Sutton Drive at Corporate Drive

Horizon Year	Operations
All Total Horizons	Within Capacity

At the all-way stop-controlled internal site intersection of Sutton Drive at Corporate Drive, all approaches are forecast to operate within capacity with a LOS A or better during the weekday and Saturday peak hours.

As per comments from the City, alternative traffic control is considered including signalization and roundabout configurations. All three intersection controls are expected to accommodate vehicle traffic without issue. However, considering the land requirements and pedestrian crossings, an all-way stop controlled intersection control is recommended.

Full Build-Out Assessment

The full build-out is anticipated to be completed in a horizon beyond Year 2045 (10 years after Phase 1 Build-Out), at an unknown time.

The concept shows Phases 2 to 4 located between Sutton Road and Burloak Drive. The development application is for the Phase 1 lands only. However, to provide a high-level long-range assessment of the potential road improvements required to accommodate the possible development, a Full Build-Out scenario has been assessed.

The Full Build-Out stats are based on high-level assumptions of development densities, community needs, and are subject to change.

Under the 2045 horizon year, many study area intersections are forecast to operate at or near their functional capacity. Since the Full Build-Out site traffic assignment adheres to the same methodology utilized in Phase 1, the majority of impacted movements have already been identified, with appropriate mitigation measures previously proposed to address these constraints.

Overall, the study area intersections are forecast to operate at similar levels to the Phase 1 2045 Total Scenario; the exceptions being the new site access intersections for the future phases. The following capacity constraints at the new site access intersections are identified.

Upper Middle Road at Blue Spruce Avenue

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

Under Full Build-Out of the site, Blue Spruce Avenue is proposed to extend south of Upper Middle Road to provide access to the development. With Phase 1 mitigation measures, the intersection has been assumed to be signalized by Full Build-Out. With site-generated traffic volumes, the westbound approach is forecast to operate at LOS C and v/c ratios exceeding 0.95 during the weekday PM peak hour.

To accommodate for the additional Full Build-Out site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Signalizing the intersection (OTM Warrants satisfied); and
- Left-turn Lane and protected-permissive phase for westbound traffic.

Overall, signalization is recommended to reduce delays for northbound and southbound approaches and support walkability in the study area.

Burloak Drive at Corporate Drive/ Bronte Creek Park Access

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

With future phases of the development, Corporate Drive is proposed to be extended east through the development lands, providing a new access to site from the existing Burloak Drive at Bronte Creek Park intersection. The intersection has been assumed to be signalized under the Phase 1 mitigation measures.

The addition of site-generated traffic degrades the northbound approach to operate with delays in the LOS A-E range and a v/c ratio greater than 0.90 during the peak hours.

To accommodate for the additional Full Build-Out site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Signalizing the intersection (OTM warrants satisfied); and
- Implement a left-turn lane and phase for northbound traffic.

In the Phase 1 mitigation measures, signalization was identified as potential improvement although the signal was unwarranted. With the Full Build-Out of the site, the signal is warranted. Overall, with the mitigation measures, the intersection is forecast to operate with delays in the LOS D range or better with v/c ratios less than 0.85 during the peak hours.

A traffic signal is also expected to improve pedestrian and cycling safety by providing a control crossing of Burloak Drive.

Burloak Drive at Site Access C

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

A future connection at Burloak Drive at Site Access C is planned to provide additional access to the development, located south of the Burloak Drive at Bronte Creek Park/Corporate Drive intersection. Under the assumed two-way stop-control, the eastbound approach is forecast to operate with delays in the LOS F range.

To accommodate for the additional Full Build-Out site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Signalizing the intersection (OTM warrants not satisfied);
- Northbound left-turn lane as per left-turn warrant;
- Northbound left-turn protected-permissive phase; and
- Separate eastbound left-turn and right-turn lanes.

Overall, with the mitigation measures, the intersection is forecast to operate with delays in the LOS C range or better with v/c ratios less than 0.85 during the peak hours.

A traffic signal is also expected to improve pedestrian and cycling safety by providing a control crossing of Burloak Drive.

Mainway at Sutton Drive

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

The Full Build-Out scenario is forecast to operate similarly to the Phase 1 2045 horizon. Even with Phase 1 mitigation measures, several movements are still projected to experience critical movements including the eastbound left, westbound through-left, northbound approach, and southbound approach.

To accommodate for the additional Full Build-Out site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Separate southbound left-turn and through-right lanes; and
- Separate westbound-right turn lane.

Reconfiguring the lane layout and signalizing the intersection is projected to improve the operations of the intersection. However, several movements are still projected to experience critical movements particularly during the weekday PM peak hour.

Delays can be attributed to the high traffic volumes along Mainway and Sutton Drive.

Mainway at Site Access B

Horizon Year	Operations
2045 Total (Full Build-Out)	Within Capacity

A new site connection at Mainway and Site Access B is provided to accommodate for additional site generated traffic for the Office Park development located along Mainway, east of Sutton Drive. The following mitigation measures were implemented in the analysis:

- Implement an eastbound left-turn lane as per left-turn warrant.

Overall, operations are expected to be at acceptable levels with delays in the LOS C range or better during the peak hours.

Neighbourhood Impact Assessment

To support the development, the Applicant will be responsible for the costs related to new roadway connections to Upper Middle Road, Burloak Drive, and Mainway, which includes left turn lanes and traffic control signals. Moreover, the Applicant will bear the cost of potentially unwarranted traffic control signals due to the deterioration of operations at the intersection of Upper Middle Road at Blue Spruce Avenue, Burloak Drive at Site Access A, Burloak Drive at Corporate Drive, and Mainway at Sutton Drive, caused by the build-out of the development. This is reflected based on the assessment of the intersections projected to operate over capacity due to site generated traffic.

Based on the road classification and network connectivity, most site traffic is expected to use Upper Middle Road, Burloak Drive, and Mainway to access the site.

It is not expected that Sutton Drive (north of Upper Middle Road) or the potential Corporate Drive connection will used significantly by development traffic due to the distance, stop-controlled intersections, and local road designs.

Transportation Demand Management

A key TDM strategy will be the provision of public transit to this area. The use of transit places less reliance on personal automobiles for trips that can be completed with convenient and desirable transit options. The subject site is currently served by four Burlington Transit routes that operate primarily on Upper Middle Road, Mainway, and Appleby Line and provide connections to Appleby GO, Burlington GO, and GO Bus 407 Carpool Stations; however, additional routes and capacity should be provided to serve the future community.

The development lands also lend themselves to TDM benefits associated with mixed or multi-use development. This form of development supports sustainability initiatives by promoting complementary land uses in close proximity.

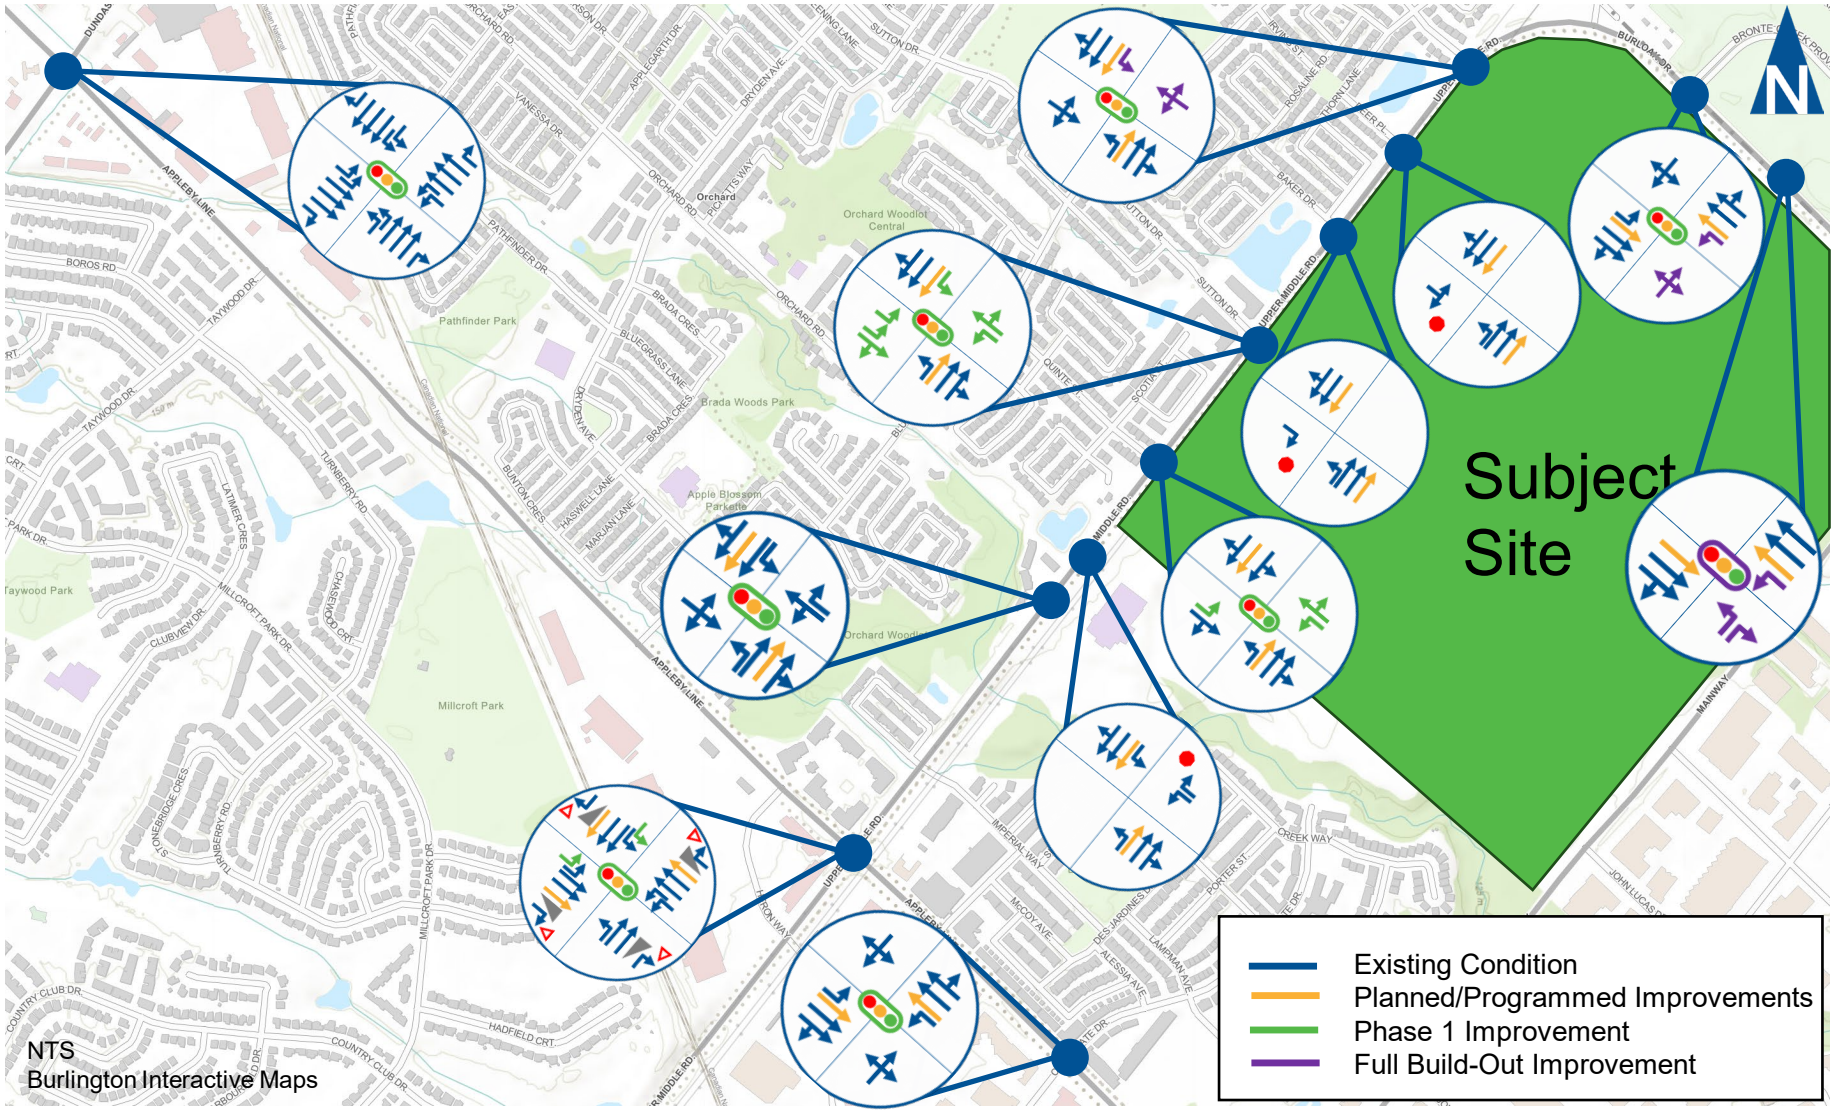
The future traffic operations with the development cannot be fully mitigated by auto infrastructure improvements alone. This is recognized in the City of Burlington’s Official Plan, which identifies an integrated and multi-modal transportation system that will be achieved by prioritizing decision-making to shift more trips away from the private car and to more sustainable transportation options, such as walking, biking, transit and car sharing.

Future plans include High Occupancy Vehicle (HOV)/Bus Lanes along Upper Middle Road and Burloak Drive. The provision of high-density mixed-use developments in the proposed development is essential to achieving the goals of the City.

As individual development blocks are build-out, TDM measures will be included in the site plan design and reviewed through the SPA process.

Recommendations

Based on the findings of this study, it is recommended that:



- The road authority plan for the future implementation of the remedial measures summarized in **Table E.1**. **Figure E.1** illustrates the proposed remedial measures.
- The Applicant will work with the road authorities to determine appropriate cost sharing contributions for the planned roadway improvements outlined in **Table E.1**.
- The City should plan to meet its mode share targets by continuing to promote TDM measures and supporting shifts to alternative modes of travel to reduce single-occupant vehicle trips
- Burlington Transit consider adding new transit routes and infrastructure to serve the proposed development.

TABLE E.1: PROPOSED MITIGATION MEASURES

Intersection	Improvement	Horizon Year	Applicant Responsibility
Appleby Line & Dundas Street	Signal timing adjustments	2035 Background	No
Appleby Line & Upper Middle Road	Double westbound left-turn lanes	Base Year; All Horizons	No
	Double southbound left-turn lanes		
	Signal timing adjustments		
West School Driveway/Private Driveway & Upper Middle Road	Signal timing adjustments	2045 Background	No
Quinte Street & Upper Middle Road	Signalization (OTM Warrants satisfied)	2035 Total	**Yes**
	Northbound left-turn lane (30 m storage)		
	Southbound left-turn lane (45 storage)		
Sutton Drive & Upper Middle Road	Double southbound left-turn lanes	2035 Total	**Yes**
	Northbound left-turn lane (30 m storage)		
	Westbound left-turn lane (60 m storage)		
	Adjusted signal timings		
Blue Spruce Avenue & Upper Middle Road	Signalization (Unwarranted)	Base Year; All Horizons	No
	Westbound left-turn lane	Full Build-Out	**Yes**
Burloak Drive & Corporate Drive/ Park Access	Signalization (Unwarranted)	Base Year; All Horizons	No
	Northbound left-turn lane	Full Build-Out	**Yes**
Burloak Drive & Site Access C	Signalization (OTM Warrants not satisfied)	Full Build-Out	**Yes**
	Northbound left-turn lane		
	Eastbound left-turn lane		
Burloak Drive & Mainway	Double northbound left-turn lanes	2035 Background	No
	Adjusted signal timings		
Mainway & Sutton Drive	Signalization (OTM Warrants satisfied)	2035 Total	**Yes**
	Eastbound left-turn lane (25 m storage)		
	Westbound right-turn lane	Full Build-Out	**Yes**
	Southbound left-turn lane		
Corporate Drive & Sutton Drive	Signalization (Unwarranted)	Full Build-Out	**Yes**
Site Access A & Mainway	Eastbound left-turn lane (15 m storage)	2035 Total	**Yes**
Site Access B & Mainway	Eastbound left-turn lane	Full Build-Out	**Yes**

1 Introduction

1.1 Overview

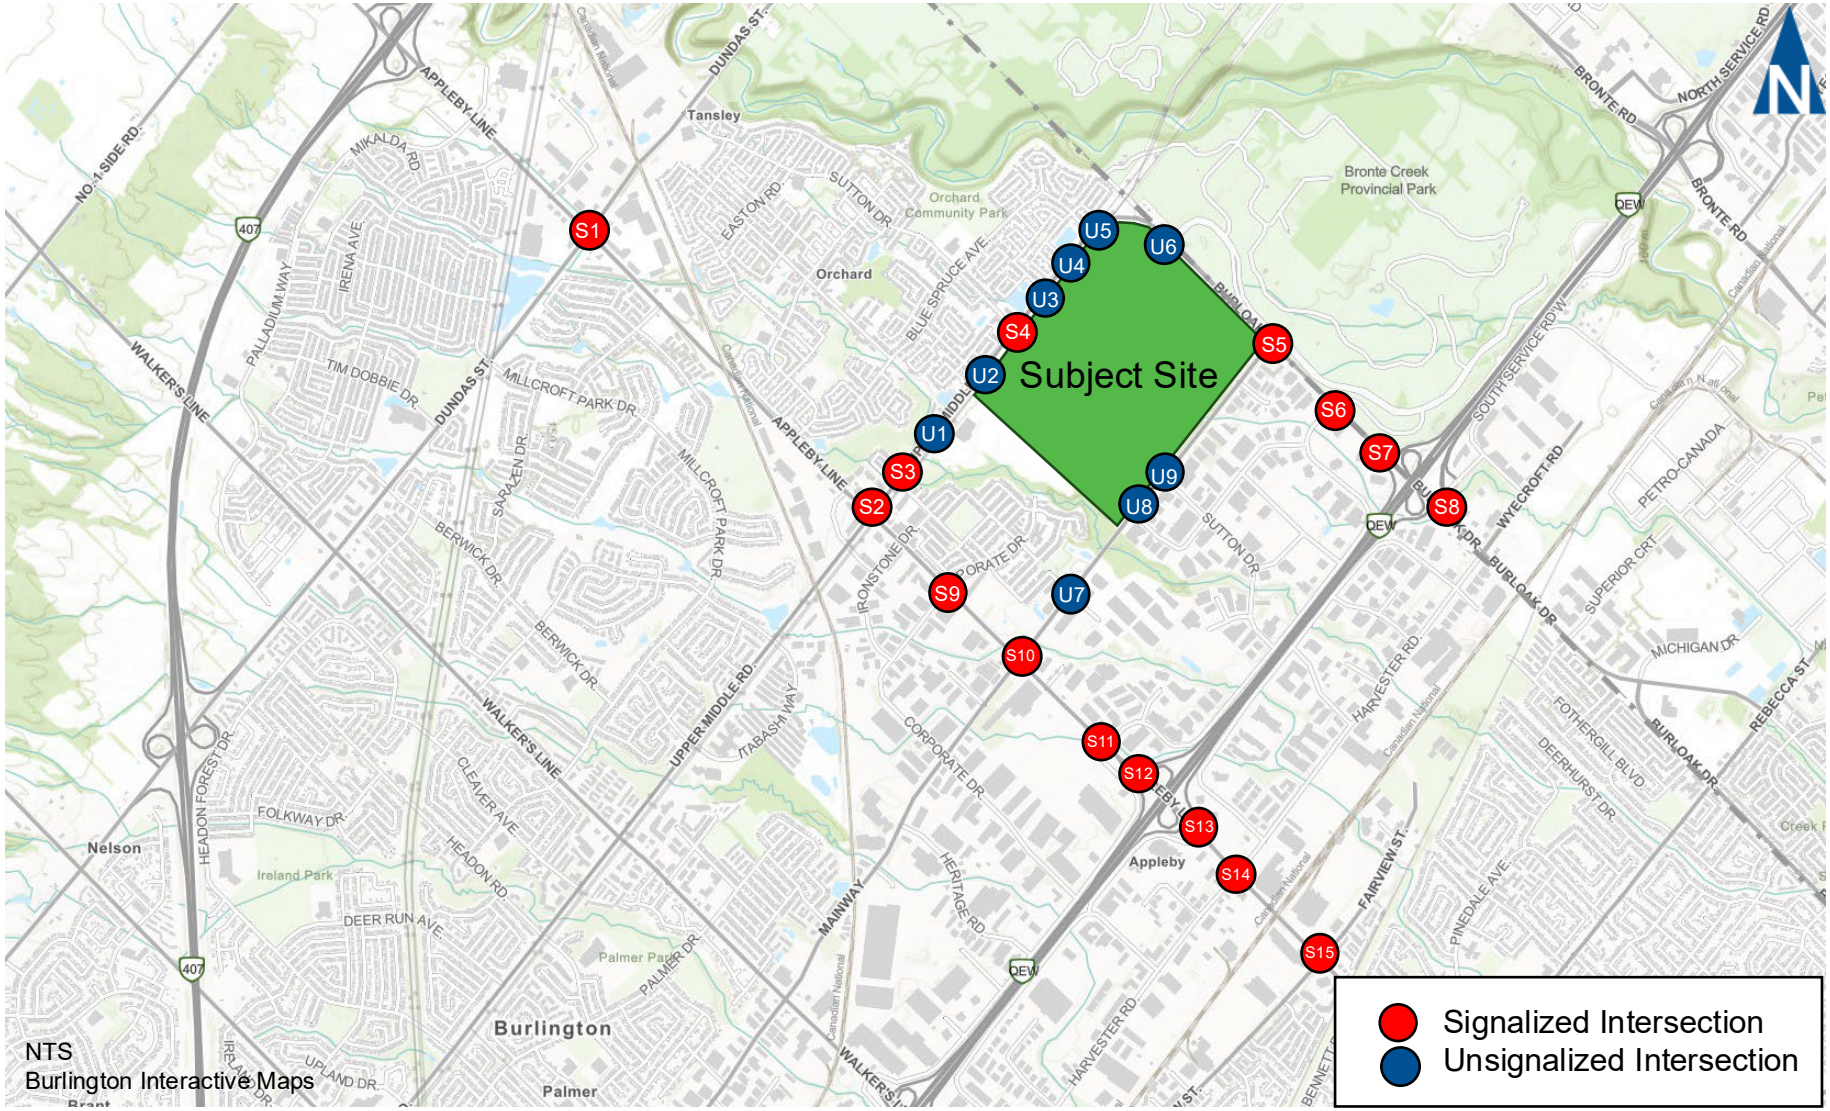
Paradigm Transportation Solutions Limited (Paradigm) was retained to conduct this Transportation Impact Study (TIS) for the proposed Phase 1 development of the Bronke Creek subdivision. The site is generally located at the northwest corner of the Mainway and Burloak Drive intersection in the City of Burlington. **Figure 1.1** illustrates the site location and study area intersections assessed in the study.

The scope of the study includes:

- Assessment of the current traffic conditions within the study area for the weekday AM and PM peak hours and Saturday mid-day peak hour.
- Estimates of background traffic growth;
- Estimates of additional traffic generated by the subject site;
- Analyses of the impact of the future traffic on the surrounding road network;
- Recommendations necessary to mitigate this future traffic satisfactorily;
- A Multi-modal Level of Service (MMLOS) assessment;
- A corridor study to examine the traffic volumes along Appleby Line between Highway 407 and Dundas Street; and
- A transit assessment to identify potential transit routes within the subdivision.

Pre-study consultation was conducted with the City of Burlington, Halton Region, and the Ministry of Transportation Ontario (MTO). **Appendix A** contains the pre-study consultation material.

The study aims to assess current traffic and the additional traffic generated by the proposed Phase 1 of the development, analyze the traffic impact on the adjacent roadway network and provide the municipality and owner with any improvements required to mitigate the identified effects of the site-generated traffic.



As the development application progresses, updates to the TIS may be required to reflect changes in the concept plan.

1.2 Study Area

This study examines the weekday AM, PM, and Saturday peak hours for the following study area intersections:

- Appleby Line Corridor
  - Appleby Line at Dundas Street (signalized)
  - Appleby Line at Upper Middle Road (signalized)
  - Appleby Line at Corporate Drive (signalized)
  - Appleby Line at Mainway (signalized)
  - Appleby Line at QEW WB Off-Ramp (signalized)
  - Appleby Line at QEW EB Off-Ramp (signalized)
  - Appleby Line at Fairview Street (signalized)
  - Appleby Line at Harvester Road (signalized)
- Upper Middle Road Corridor
  - Upper Middle Road at Corpus Christi Catholic Secondary School West Driveway (West School Driveway) (signalized)
  - Upper Middle Road at Corpus Christi Catholic Secondary School East Driveway (East School Driveway) (unsignalized)
  - Upper Middle Road at Quinte Street (unsignalized)
  - Upper Middle Road at Sutton Drive (signalized)
  - Upper Middle Road at Baker Drive (unsignalized)
  - Upper Middle Road at Deer Place (unsignalized)
  - Upper Middle Road at Blue Spruce Avenue (unsignalized)
- Burloak Drive Corridor
  - Burloak Drive at Bronte Creek Provincial Park (unsignalized)
  - Burloak Drive at Mainway (signalized)
  - Burloak Drive at North Service Road (signalized)
  - Burloak Drive at QEW WB Off-Ramp (signalized)
  - Burloak Drive at QEW EB Off-Ramp (signalized)
- Mainway Corridor
  - Mainway at Lampman Avenue/Norjohn Court at (unsignalized)

- New Subdivision Access Intersections
  - Mainway at Site Access A (unsignalized)
  - Mainway at Sutton Drive (unsignalized)
- Internal Subdivision Intersections
  - Blue Spruce Avenue at Corporate Drive (unsignalized)

Figure 1.1

2 Existing Conditions

2.1 Road Network

The roadways of interest within the study area are generally described as follows:

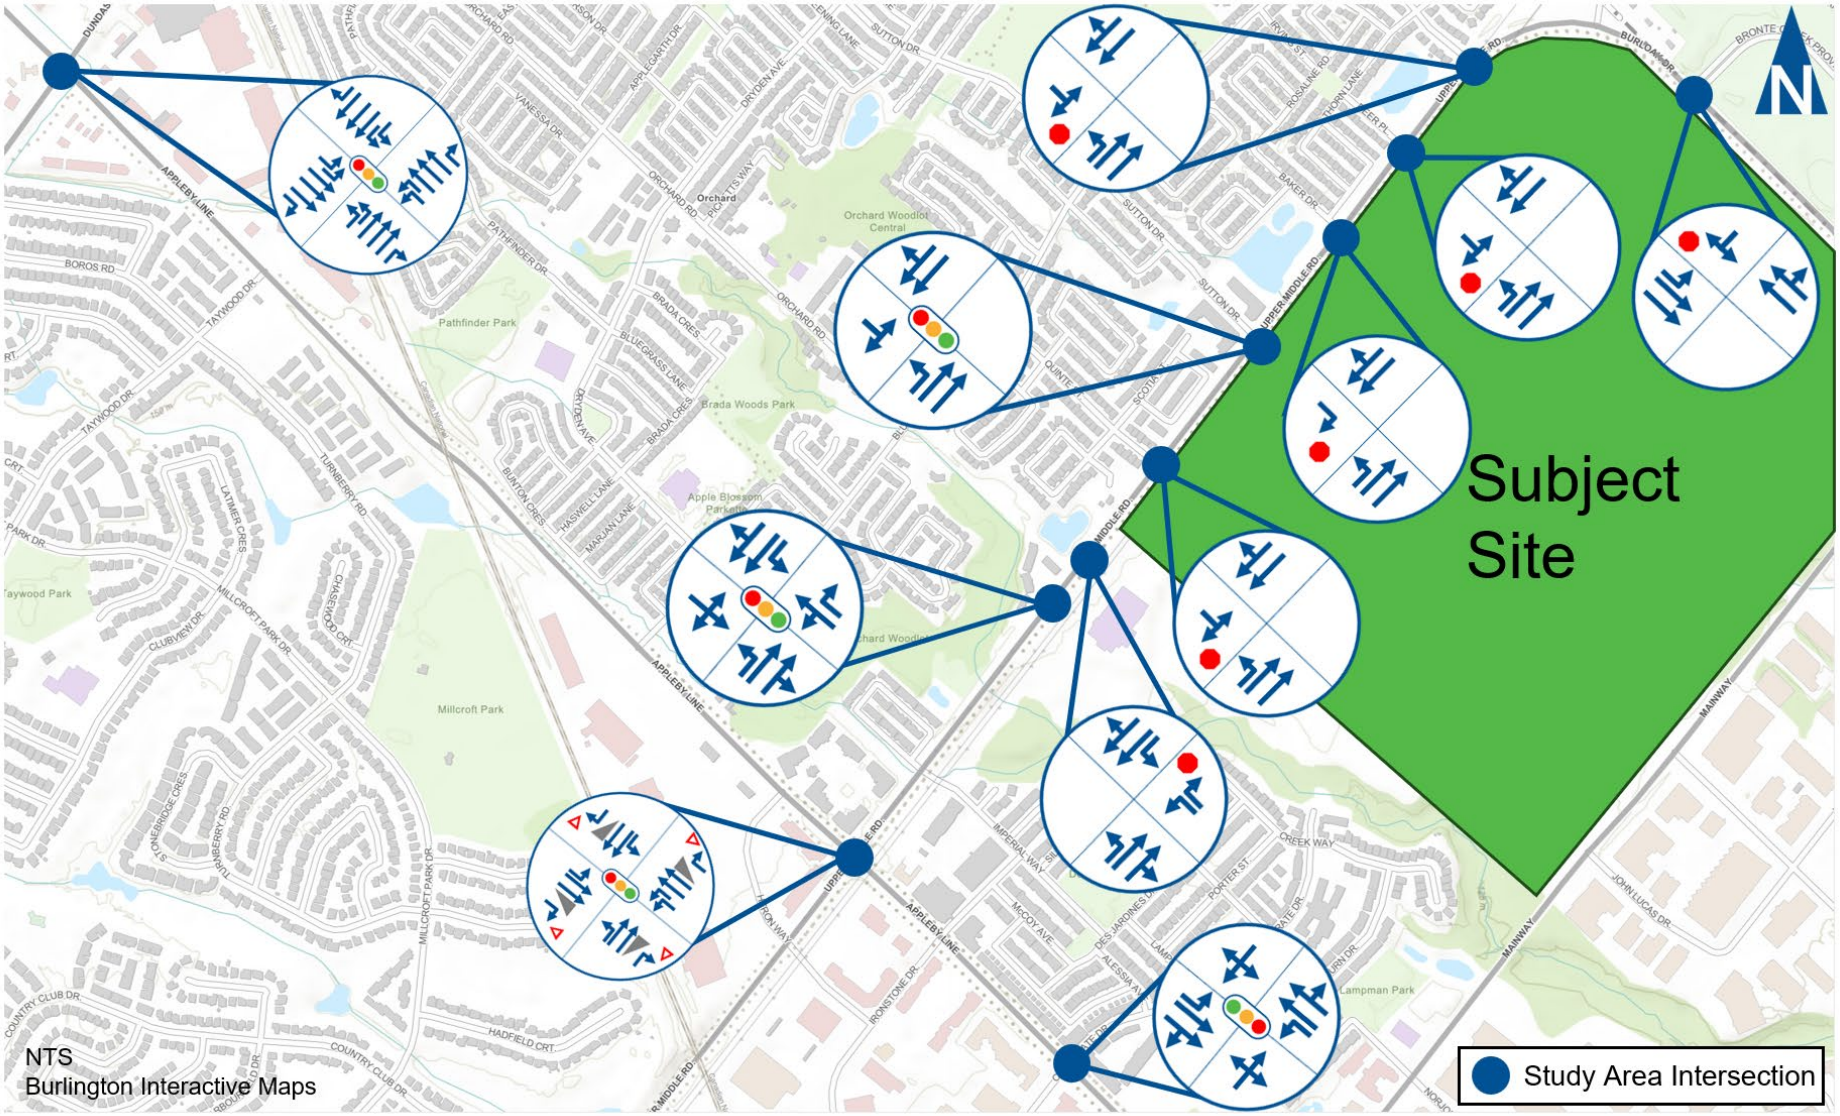
Highway/Arterial Roads

- **Queen Elizabeth Way (QEW)** is an east-west provincial highway with a six-lane divided cross-section. The posted speed limit along this roadway is 100 km/h. The eastbound and westbound ramps to Appleby Road and Burloak Drive operate with traffic control signals.
- **Appleby Line** is a north-south major arterial roadway with a six-lane cross section north of Taywood Drive, a four-lane cross-section at the Upper Middle Road intersection, a five-lane cross-section south of Corporate Drive. It has a posted speed limit of 60 km/h. There are sidewalks on both sides of the road. On-street cycle lanes are on both sides of the road, north of Mainway.
- **Dundas Street** is an east-west major arterial[1] roadway with a four-lane cross-section and a posted speed limit of 60 km/h. Active transportation facilities include sidewalks on both sides of the road.
- **Fairview Street** is an east-west multi-purpose arterial roadway with a five-lane cross-section west of Appleby Line, and a four-lane cross-section to the east. The roadway has a posted speed limit of 60 km/h. Active transportation facility include sidewalks and on-street cycling lanes along both sides of the roadway.
- **Upper Middle Road** is an east-west major arterial roadway with a four-lane cross-section and a posted speed limit of 60 km/h. The school zone for Corpus Christi Catholic Secondary School West Driveway operates as a flashing 40 km/h zone during school bell times. Active transportation facilities include sidewalks and on-street cycling lanes on both sides of the road. East of Blue Spruce Avenue, Upper Middle Road curves north-south and becomes Burloak Drive.
- **Burloak Drive** is a north-south major arterial roadway with a four-lane cross-section. The road has a posted speed limit of 60 km/h. Active transportation facilities include sidewalks on the

[1] The City of Burlington Official Plan, Schedule O-1: Classification of Transportation Facilities Urban Area, November 2020

west side of the road. On-street cycling lanes are provided on both sides of the road.

Industrial Connectors



- **Harvester Road** is classified as an industrial connector roadway west of Appleby Line and a multi-purpose arterial to the east. The roadway has a four-lane cross-section with a posted speed limit of 60 km/h. Active transportation facilities include sidewalks on both sides of the road.
- **Mainway** is an east-west industrial connector roadway with a four-lane cross-section and a posted speed limit of 60 km/h. Active transportation facilities include sidewalks on the south side of the road between Lampman Avenue and Burloak Drive and on the both the north and south sides between Lampman Avenue and Appleby Line.
- **North Service Road** is an east-west industrial connector roadway with a two-lane cross-section and a posted speed limit of 60 km/h. Active transportation facilities include a sidewalk on the north side of the road.

Local/Neighbourhood Connectors

- **Corporate Drive** is a neighbourhood connector with a two-lane cross-section and regulatory speed limit of 40 km/h. Active transportation facilities include sidewalks on both sides of the road, east of Appleby Line. On-street cycling lanes are provided on both sides of the road, east of Appleby Line.
- **Baker Drive, Deer Place,** and **Blue Spruce Avenue are** north-south neighbourhood connector roadways with two-lane cross-sections and posted speed limits of 40 km/h. Active transportation facilities include a sidewalk on the west side of the road.
- **Lampman Avenue/Norjohn Court** is a north-south local roadway with a two-lane cross-section and a regulatory speed limit of 50 km/h south of Mainway, and a posted speed limit of 40 km/h to the north. Active transportation facilities include sidewalks on both sides of the road, north of Mainway.
- **Quinte Street** is a north-south neighbourhood connector roadway with a two-lane cross-section and a posted speed limit of 40 km/h. Active transportation facilities include sidewalks on both sides of the road.
- **Sutton Drive** is a north-south neighbourhood connector roadway with a two-lane cross-section and a posted speed limit

of 40 km/h. Active transportation facilities include sidewalks on the road's east and west sides. On-street cycling lanes are provided on both sides of the road.

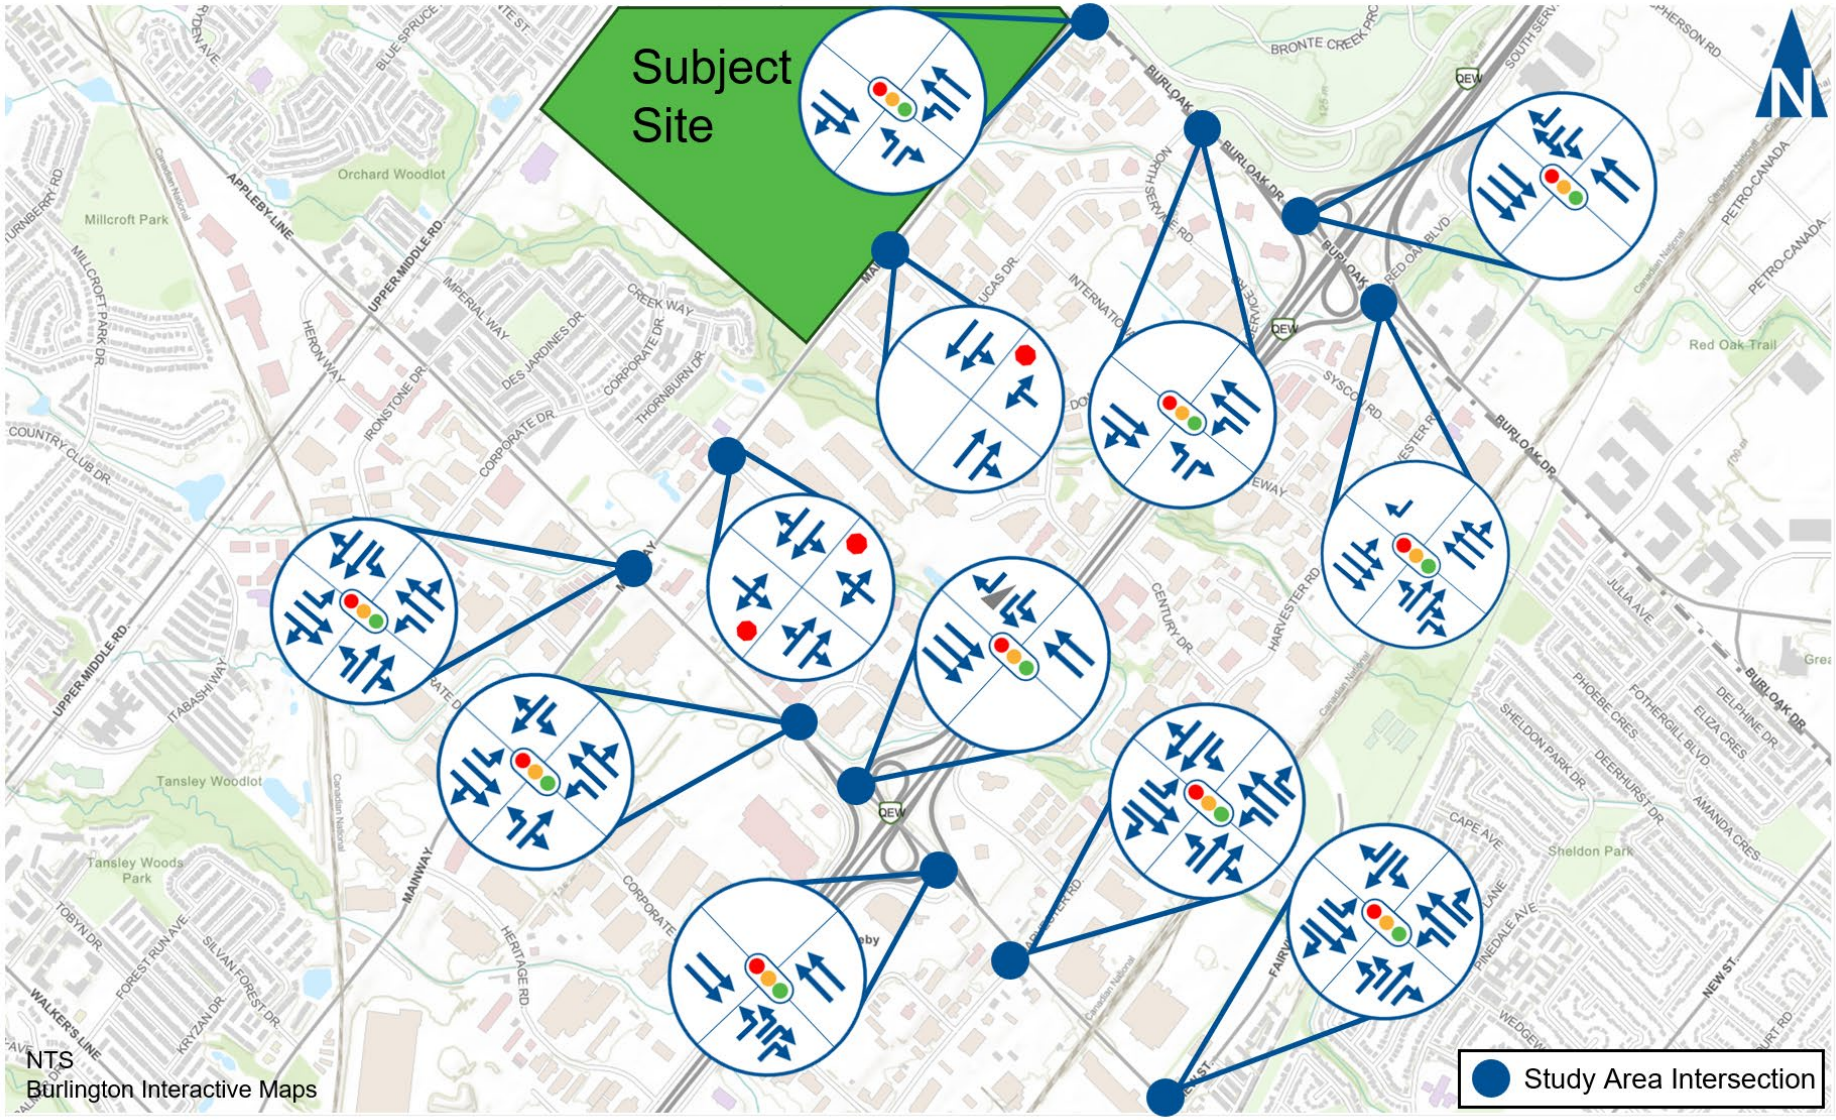


Figure 2.1 illustrates the existing lane configuration and traffic control at the study area intersections.

Figure 2.1B

2.2 Pedestrian and Cycling Network

Pedestrian infrastructure within the study area includes sidewalks or multi-use paths parallel to the roadway. **Figure 2.2** illustrates the existing pedestrian infrastructure.

Cycling infrastructure within the study area typically consists of on-street and off-street facilities. On-street facilities include cycling lanes, signed cycling routes, and paved shoulders. Off-street facilities are in the form of multi-use or informal trails.

The study area's active transportation facilities include sidewalks on at least one side of the road along Appleby Line, Upper Middle Road, Quinte Street, Sutton Drive, Baker Drive, Deer Place, Blue Spruce Avenue, Burloak Drive, Corporate Drive, Mainway, Lampman Avenue/ Norjohn Court, and North Service Road.

On-street bike lanes are provided on both sides of the road along Appleby Line, Upper Middle Road, Burloak Drive, Corporate Drive, and Sutton Drive.

The City of Burlington Cycling Plan[2] indicates future improvements to the city cycling network. These improvements include protected bikeways along Mainway and North Service Road through the study area.

Figures 2.3 and **2.4** illustrate the existing and future cycling network within the study area.

2.3 Transit Service

2.3.1 Burlington Transit

Burlington Transit[3] is the public transit operator in the City of Burlington. **Figure 2.5** illustrates the existing transit network relative to the subject site's location. The following routes provides direct connections to the site:

- **Route 11 (Sutton-Alton)** provides service between the Appleby GO station and the GO 407 Carpool Station. Weekday service is provided from 5:05 AM to 10:45 PM with 15 to 30-minute headways. On Saturdays. service is provided from 7:05 AM to 10:10 PM, with 30-minute headways. On Sundays, service is provided from 8:05 AM to 8:10 PM with headways of 30 minutes.
- **Route 48 (Millcroft)** provides service between the Corpus Christi Secondary School and Haber Community Centre from Monday to Friday. A single bus is provided for the route during the AM and PM, with the AM service operating from 7:35 AM to 8:25 AM and the PM service from 2:30 PM to 3:15 PM.
- **Route 51 (Burlington Northeast – Night Service)** operates in a loop from the Burlington GO Station to the Dundas Street at Sutton Drive and back. Service is provided from Monday to Saturday from 10:55 PM to 1:30 AM with headways of 60 minutes.
- **Route 81 (Harvester/ North Service)** provides service between the Burlington GO Station and Appleby GO Station from Monday to Friday. Service begins at 5:30 AM to 7:10 PM with headways of 30 minutes.

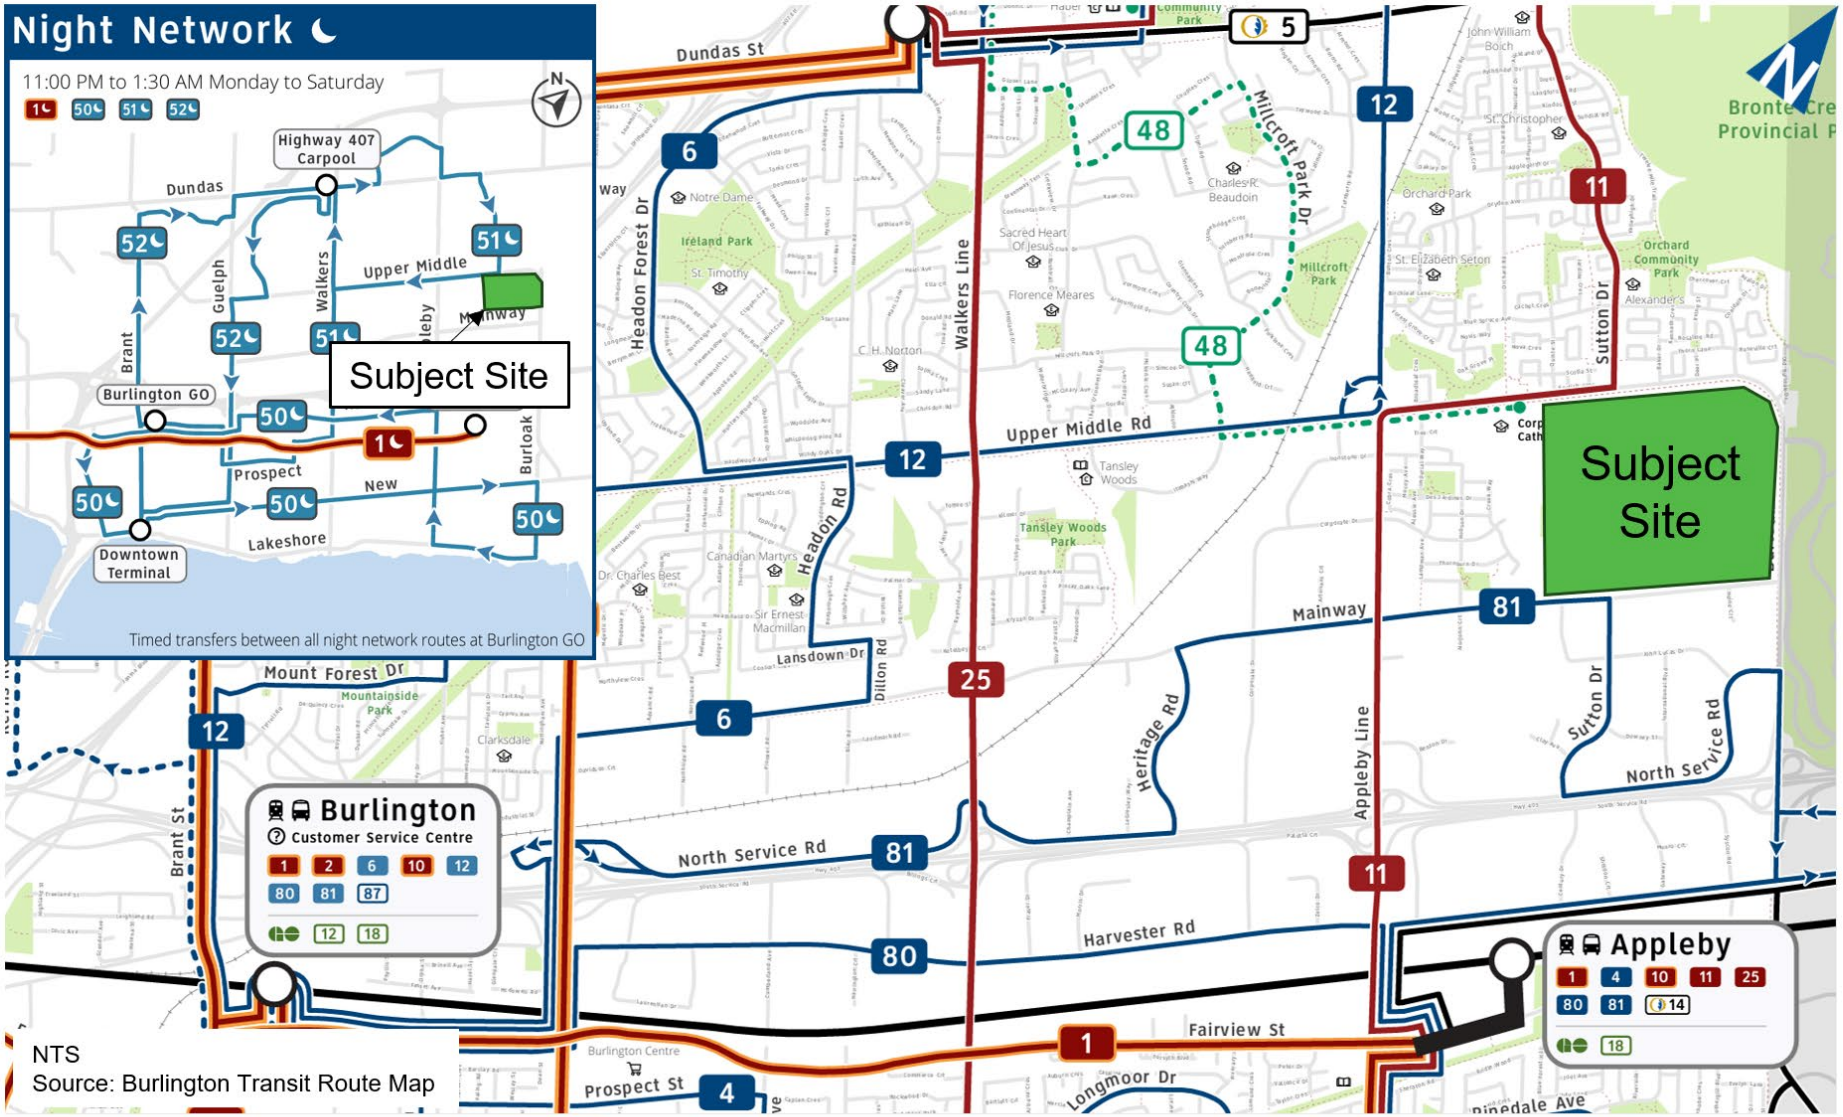
The bus stops serving these routes are conveniently located near the site access intersections, making it easily accessible for development residents. Stops for routes 11 and 51 can be found along Sutton Drive, less than 135 m north of the Upper Middle Road, measured centreline to centreline. Stops serving this route are also provided at the intersection of Upper Middle Road and Quinte Street.

Route 48 is served at the intersection of the East Driveway of Corpus Christi Secondary School and Upper Middle Road, less than 165 m west of Quinte Street.

Route 81 is located approximately 70 m south of the intersection of Sutton Drive and Mainway, along Sutton Drive. Stops for this route are

[3] Burlington Transit Ride Guide | City of Burlington, Ontario, Canada

also provided at the intersection of Norjohn Court and Lampman Avenue.



The City of Burlington aims to provide Frequent Transit Corridors, which are defined as "a priority component of the city-wide public transit network. The long-term frequent transit corridors consist of the following two components"[4]:

- "Frequent Transit Corridors have existing and/or planned land uses, and street design conditions to enable a frequent service;" and
- "Candidate Frequent Transit Corridors have some of the existing and/or planned land uses and street design conditions which may enable a frequent service in the future."

Appleby Line is identified as a Frequent Transit Corridor[5] within the study area.

The City of Burlington Integrated Mobility Plan[6] (IMP) and Halton Region TMP[7] identify that Burloak Drive and Upper Middle Road are to be widened between QEW and Appleby Line from four to six lanes and convert the curb lanes to high occupancy vehicle (HOV) or bus rapid transit (BRT) lanes after completion of the road widening.

Figure 2.5

2.3.2 GO Transit

The subject site has convenient access to the Appleby, and the 407 Carpool GO stations.

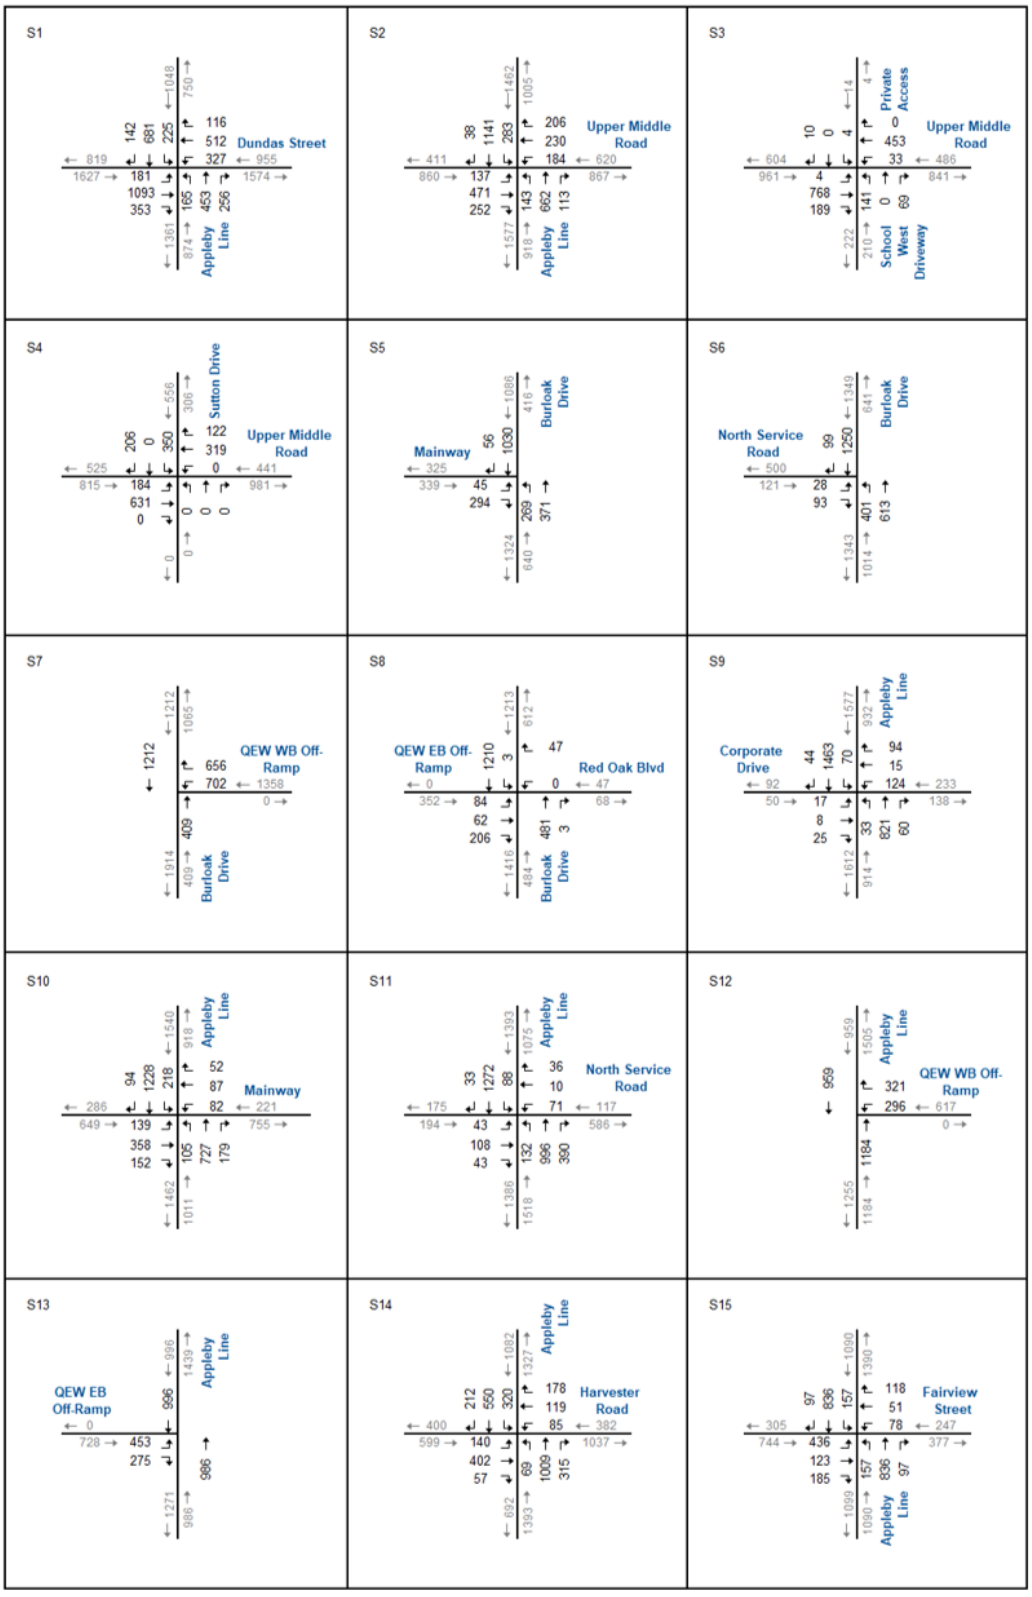
Appleby GO station is located approximately 4 km southwest of the site, translating to a 5-minute drive or 25-minute bus ride using route 11 or 81.

The 407 Carpool GO station is located approximately 7 km northwest of the site, and it is an 11-minute drive or 30-minute bus ride using route 11. As this GO line provides bus and/or train service to major cities including Downtown Toronto, it is a significant transportation link for residents and commuters in the region.

2.4 Traffic Volumes

Pyramid Traffic collected Turning Movement Counts (TMC) data at the study area intersections in October 2023, September 2024, and November 2024. A growth rate of 1% has been applied to the 2023 count data to estimate a Year 2024 base year. **Appendix B** contains the existing count data.

Traffic volumes at the QEW Appleby and Burloak Drive free-flow on-ramps are shown on the volume diagrams for illustrative purposes only. These ramps are located between intersections, operate as free-flow lanes, and generally have minimal impact on the intersections. As such, these operation analysis for the on-ramps were not conducted. Volumes for these on-ramps were not explicitly counted and are estimated based on the difference in upstream and downstream traffic flows.



Volume balancing has not been implemented. It is noted that there may be volume differences between intersections due to existing driveways between intersections, MTO on-ramps, and slight variation in peak hours.

Figure 2.6 – 2.8 illustrates the existing peak-hour traffic volumes.

Appendix C contains a full network diagram showing the existing traffic volumes.

Section 5 summaries the traffic operations for the base year condition and future horizon years.

3 Development Concept

3.1 Development Description

Bronte Creek Meadows is a mixed-use subdivision with employment, institutional, retail, and a variety of low, medium, and high-density residential along with parkland and open space. **Figure 3.1** illustrates the site concept plan.

The Phase 1 development plan includes approximately 697 residential units (comprised of single detached, townhomes, and apartment units), approximately 743 m^2 (8,000 sq. ft) of retail space, and 71,164 m^2 (766,000 sq. ft) of institutional space.

It is noted that the following analysis was completed with a previous site plan concept which included 788 residential units. As this previous site concept has a higher unit count, the trip generation can be considered as a conservative assessment.

The preliminary concept for the institutional space envisions a mix employment space comprised of healthcare services, institutional uses, and office uses.

These development statistics are approximate and assume a conservative estimate for the land use densities. Specific tenants are not known at this stage of the application. It should be noted that the plans are evolving, and more detailed statistics and analysis will be conducted at site plan/detailed design. Details for the full development plan is outlined in **Section 7** of the report.

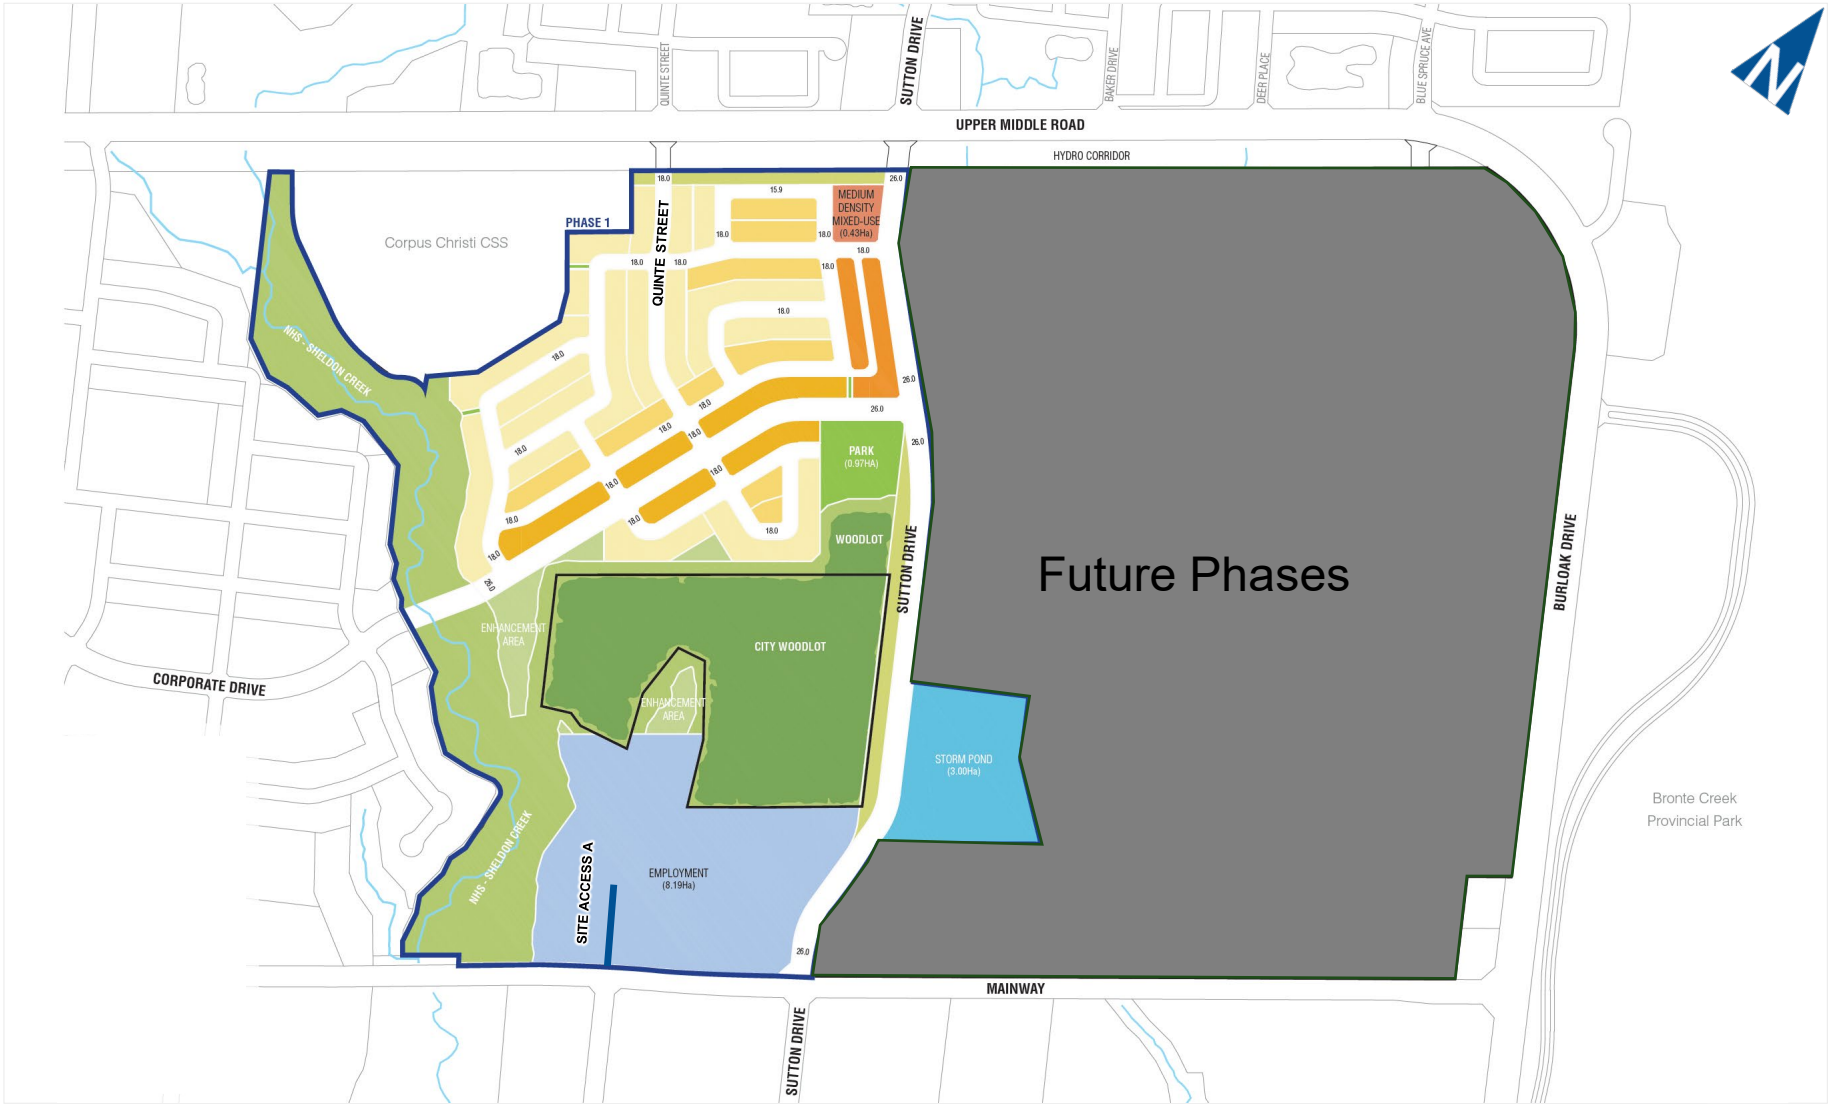
Under the Phase 1 development, vehicle access is proposed via new municipal roads to Upper Middle Road, Appleby Line, and Mainway. The main new roadways through the site are described as follows:

- Sutton Drive is proposed as a north-south roadway through the site. The roadway will connect Sutton Drive at Upper Middle Road in the north with Sutton Drive at Mainway in the south.
- Corporate Drive is proposed as an east-west roadway through the site to Sutton Drive. The road will potentially connect to the existing Corporate Drive leading to Appleby Line. The crossing over Sheldon Creek is noted to be environmentally sensitive and the timing of its completion may be subject to environmental assessment. The City has requested that the analysis assume the connection will be in place.

In addition to the proposed municipal road network, a new road connection is proposed opposite to Quinte Street at Upper Middle Road and a private driveway to Mainway for the institution block located north of the Sutton Drive are proposed. The institutional private driveway (Site Access A) is assumed to be aligned with the John Lucas Drive across Mainway.

Other internal local roads have been consolidated for the purpose of this study. At this stage of the development, the internal local road network may change as the application progresses and detailed plans for each block are developed.

Build-out of the site is anticipated to occur in multiple phases with Phase 1 estimated to be completed by Year 2035; timing subject to market conditions.



The full build-out of the lands is considered a longer-term condition. A scenario evaluating this is provided in Section 7.

Pedestrian facilities will be included on the internal roadways with sidewalks along at least one side of the road for the majority of the streets, excluding laneways. Dedicated cycling facilities will be considered along the neighbourhood collector streets such as Sutton Drive and Corporate Drive through consultation with the City.

On-street parking may be permitted on the internal streets, excluding smaller private streets and laneways subject to the City's on-street parking by-laws.

Traffic calming measures, such as speed humps, on-street parking, or flexible bollards may be considered along Sutton Drive and Corporate Drive as the primary through-roads in the subject site through consultation with the City.

The assumed internal network is subject to change, but development density targets and access points are likely to remain unchanged. This study focuses on Phase 1 of the subject site and examines long-term transportation network impacts and potential mitigation measures to support future background and site generated traffic. As the development application progresses, updates to the TIS may be required to reflect changes and phasing of the concept plan.

Figure 3.1

3.2 Trip Generation

The Institute of Transportation Engineers (ITE) Trip Generation manual[8] methods forecast site-generated trips. The following land use codes (LUCs) were referenced:

- LUC 210 (Single Family Detached Housing);
- LUC 220 (Multifamily Housing (Low-Rise));
- LUC 221 (Multifamily Housing (Mid-Rise)); and
- LUC 822 (Strip Retail Plaza).

The institutional space envisions a mix of healthcare services, institutional uses, and office uses. No tenant is known but preliminary concepts suggest a healthcare park akin to the McMaster Innovation Park, which is a prestige centre than incorporates research, business, and institutional space to combine academia and industry.

As the land use is a specialized mix of land uses, ITE does not have an LUC which encompasses the vision of the use. The site's trip generation for the institutional development is estimated using a first principles approach developed from trip data collected at the McMaster Innovation Park (MIP)[9] used to assess the long-term build-out of the Park, which consists of three buildings containing institutional, office, and commercial uses and a daily population of approximately 830 persons. Since the preliminary concepts for the institutional space draws inspiration from MIP, utilizing proxy site data from MIP provides a comparable estimate for trip generation.

It is noted that generally, additional local proxy sites would be surveyed to determine a trip rate. However, given the specialized land use and the unknown tenants, it is unlikely to find comparable sites that offer the same blend of healthcare, institutional, and office space.

Table 3.1 summarizes the estimated first principles average institutional trip generation rate per employee. Detailed institutional trip generation data can be found in **Appendix D.**

[8] Institute of Transportation Engineers, Trip Generation Manual, 11th ed., (Washington DC: ITE, 2021).
[9] McMaster Innovation Park – Trip and Parking Generation Estimate, Paradigm, November 2019.

TABLE 3.1: FIRST PRINCIPLES INSTITUTIONALTRIP GENERATION RATE

Peak Hour	Metric	Calculation
AM Peak Hour	Directional Distribution - Inbound	83%
	Directional Distribution - Outbound	17%
	Rate / Employee	**0.28**
PM Peak Hour	Directional Distribution - Inbound	21%
	Directional Distribution - Outbound	79%
	Rate / Employee	**0.25**
Saturday Peak Hour	Directional Distribution - Inbound	54%
	Directional Distribution - Outbound	46%
	Rate / Employee	**0.08**

To remain conservative, no modal split adjustments have been applied to the trip generation estimate to account for active transportation or transit-oriented trips.

3.2.1 Internal Site Capture

The ITE Trip Generation Handbook describes a multi-use development as a single project that consists of two or more ITE land use classifications in which trips can be made between land uses without using the off-site roadway system. Sharing trips between compatible land uses is an internal capture without travelling off-site.

Given the mix of land uses in the subject site, trips from compatible land uses will stay within the internal network and will not impact the existing external network. As the focus of this study is the impacts to the external network, trips between internal land uses are not assigned to the network and are treated as “internal trips”.

The ITE Trip Generation Handbook has been utilized to account for the development's internal trips. By way of example, some portion of the traffic destined to and from the retail uses located within the site will likely originate from the surrounding residential developments, requiring only an internal network vehicle trip or an active transportation trip (for example, walking or cycling). The detailed calculations are provided in **Appendix E**.

ITE data suggests an internal capture rate of between 4% and 22% for the Weekday AM/PM and Saturday peak hours.

3.2.2 Net Trip Generation Estimates

Table 3.2 summarizes the forecast site-generated trips. As noted earlier, these estimates include the standardized ITE rates with internal credits. The site's Phase 1 trip generation is estimated to be approximately 934 new vehicle trips during the weekday AM peak hour, 960 new vehicle trips during the weekday PM peak hour, and 631 new vehicle trips during the Saturday peak hour.

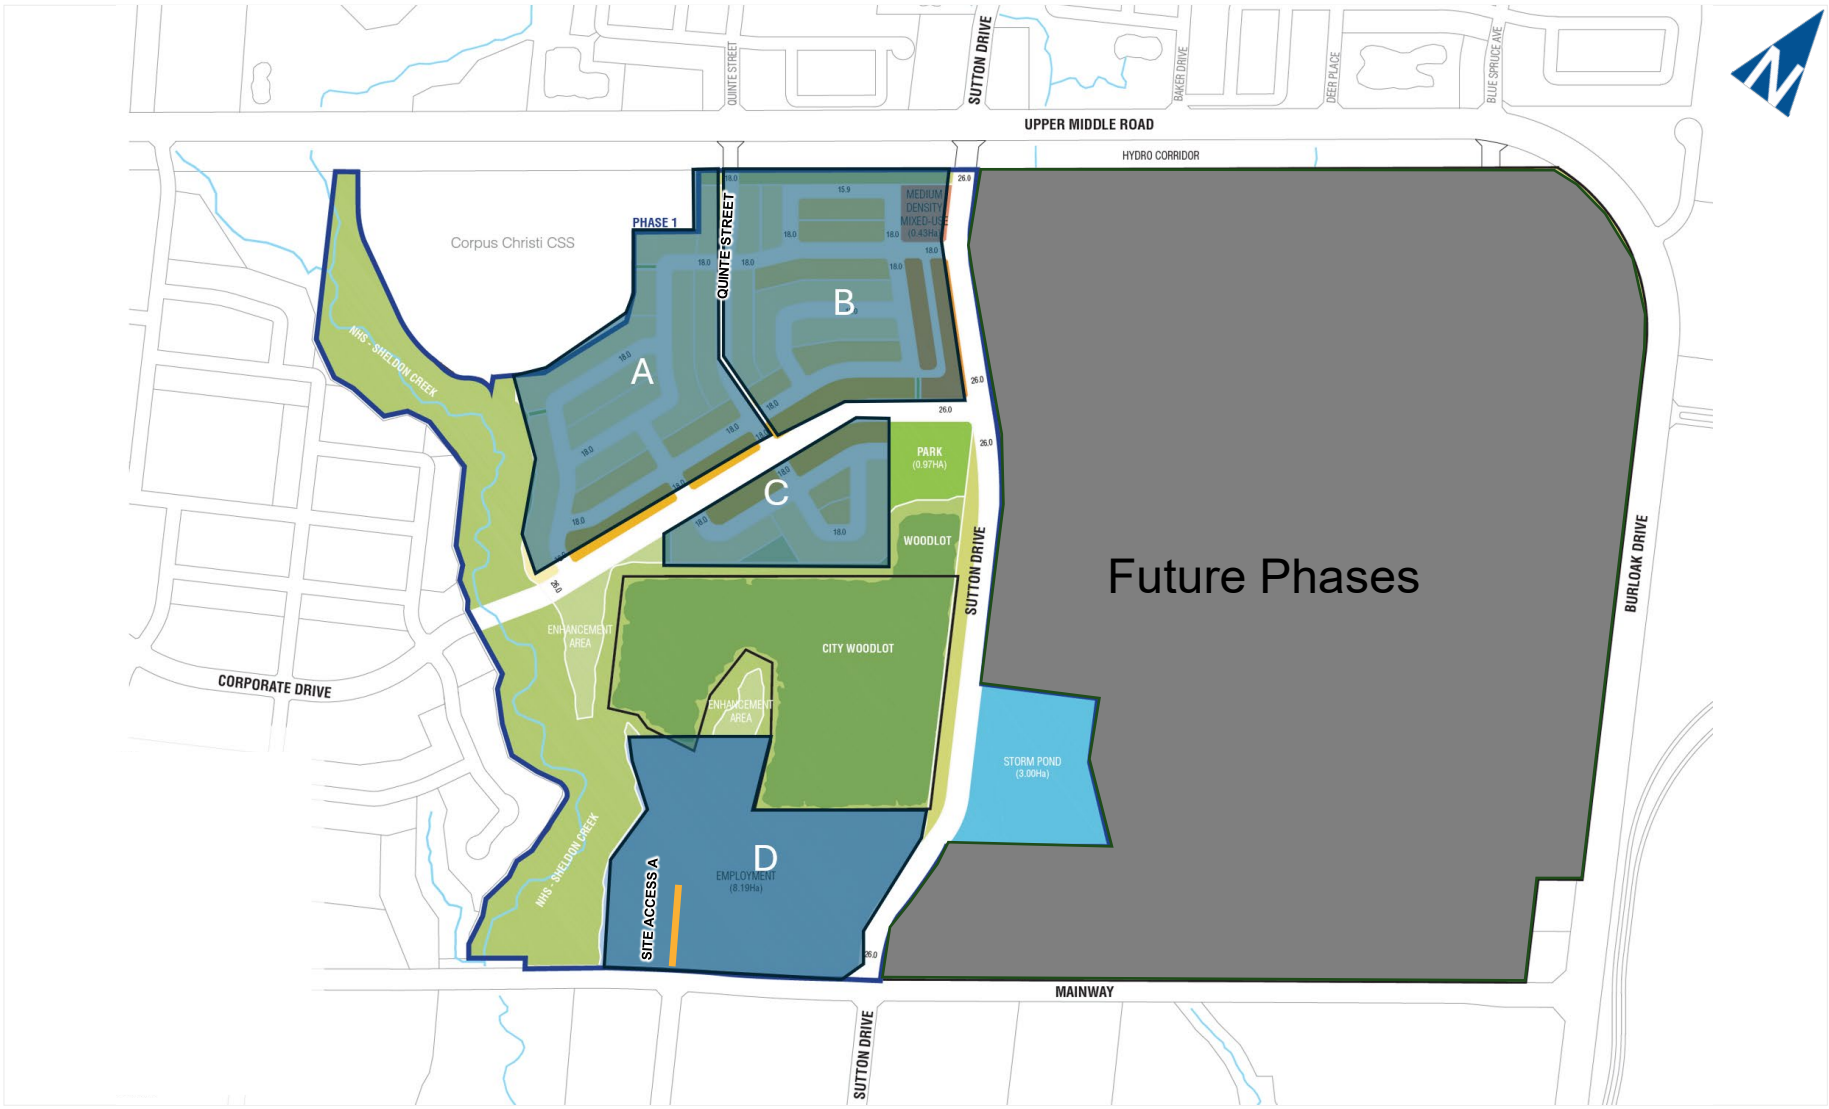

Figure 3.2 illustrates the Phase 1 site concept plan with each development block into a Traffic Analysis Zone (TAZ). **Table 3.3** summarizes the forecast site-generated trips generated by the TAZ into the total volumes per each land use code.

TABLE 3.2: ESTIMATED TRIP GENERATION

3.2.3 Appleby Major Transit Station Areas (MTSA)

The City of Burlington conducted a Transportation Assessment[10] to identify the existing and planned multi-modal transportation conditions in and around Burlington's three Major Transit Station Areas (MTSA). The study includes forecasts for population, number of jobs, person trips and planned modal splits for the Burlington MTSAs.

Appleby MTSA is forecast to have approximately 18,000 jobs and 7,000 residential units. Located within 5 km of the subject site, the Appleby MTSA is expected to have a significant draw of trips to and from the subject site.

The Appleby MTSA is centralized around the Appleby Line intersections with Fairview Street and Harvester Road and contains the Appleby GO Station. The Appleby MTSA traffic zones from the City's study are illustrated in **Appendix F**.

Based on the City's study, the Appleby MTSA is forecast to generate approximately 10,240 weekday AM peak hour auto trips and approximately 14,090 weekday PM peak hour auto trips. No Saturday peak hour forecasts were provided.

It should be noted that the trip generation estimates for the Appleby MTSA do not account for trips staying within the Appleby MTSA.

Note the MTSA study assumes a 55% auto split while the site-generated trips do not apply modal split adjustments. As such, the site-generated auto trips may be considered conservative (err on the high side) of trips generated.

Considering the MTSA total trip generation, totals trips generated by the subject site, and trips spread across the network, a reasonable amount of trips between the MTSA and subject site has been estimated based on professional judgment.

By assessing the distance from the site to the MTSA and the forecasted amount of auto trips generated by each location, engineering judgement was used to estimate an amount of trips that may travel between the two locations. Consideration was given based on the site's distribution to the Highway and other gateways into the network to not overly weight trips to the MTSA but to give some estimate on how the Appleby MTSA may influence traffic patterns within the study area.

[10] Dillon Consulting, Major Transit Station Areas – Transportation Assessment, September 2023

Approximately 12% or 500 vehicles of the site's total Full Build-Out auto trip generation (outlined in Section 7.2) is estimated to be attracted to the Appleby MTSA. The 500 site trips are estimated to be about 2-8% of total auto trips generated by the Appleby MTSA.

Based on the distribution of population around the Appleby MTSA and the potential for transit to serve the subject site, it is expected that the majority of Appleby MTSA trips will be coming from residential subdivisions located further away from the MTSA or areas with less convenient transit connections.

The estimated 12% of the subject site trips going to/from the MTSA is a reasonable proportion comparable to the number of site-generated trips estimated to be staying within the subject site.

Table 3.4 outlines the estimated auto trips for the Appleby MTSA. Auto trips from the site to the Appleby MTSA are assumed to primarily use Appleby Line. Site trips from TAZs along Burloak Drive going to Appleby MTSA traffic zones along Harvester Road will likely travel south on Burloak Drive and across Harvester Road to avoid additional left-turns. A detailed breakdown of the site-generated auto trip distribution can be found in **Appendix F.**

TABLE 3.4 APPLEBY MTSA AUTO TRIP GENERATION

Auto Trips	Weekday AM Peak Hour		Weekday PM Peak Hour		Saturday Peak Hour	
	In	Out	In	Out	In	Out
Total Appleby MTSA Trips	7,437	2,802	4,955	9,129	4,955	9,129
Site Trips to/from Appleby MTSA	310	220	220	250	250	200
Site Trips % of Appleby MTSA Trips	4%	8%	4%	3%	5%	2%

* No Saturday peak hour MTSA forecasts were provided. Saturday MTSA trips based on PM peak hour trips

A Trip Distribution Letter[11] was circulated to the City prior to this TIS for review of the trip distribution and MTSA assignment. The Trip Distribution Letter is provided in **Appendix F**.

[11] Paradigm Transportation Solutions Limited, Bronte Creek Meadows Transportation Impact Study Trip Distribution and Assignment Memo, September 2024.

3.2.4 Trip Distribution

The estimated distribution was developed using the Transportation Tomorrow Survey[12] (TTS) data for the zones containing and surrounding the subject site (4078, 4079, 4080, 4081, 4190). **Appendix G** contains the TTS data. **Table 3.5** summarizes the estimated trip distribution. Due to the absence of weekend TTS data for the distribution estimation, the weekday PM peak hour trip distribution is assumed for the Saturday peak hour.

Figures 3.3 – 3.6 illustrate the net site-generated traffic estimates for the external and internal road networks. The internal local street network has been simplified for this analysis, and multiple parcel accesses have been consolidated. This provides a conservative estimate of delay at the internal local streets as traffic in the full internal network will be spread across multiple local roads.

Appendix H contains a full network diagram showing the site generated traffic volumes.

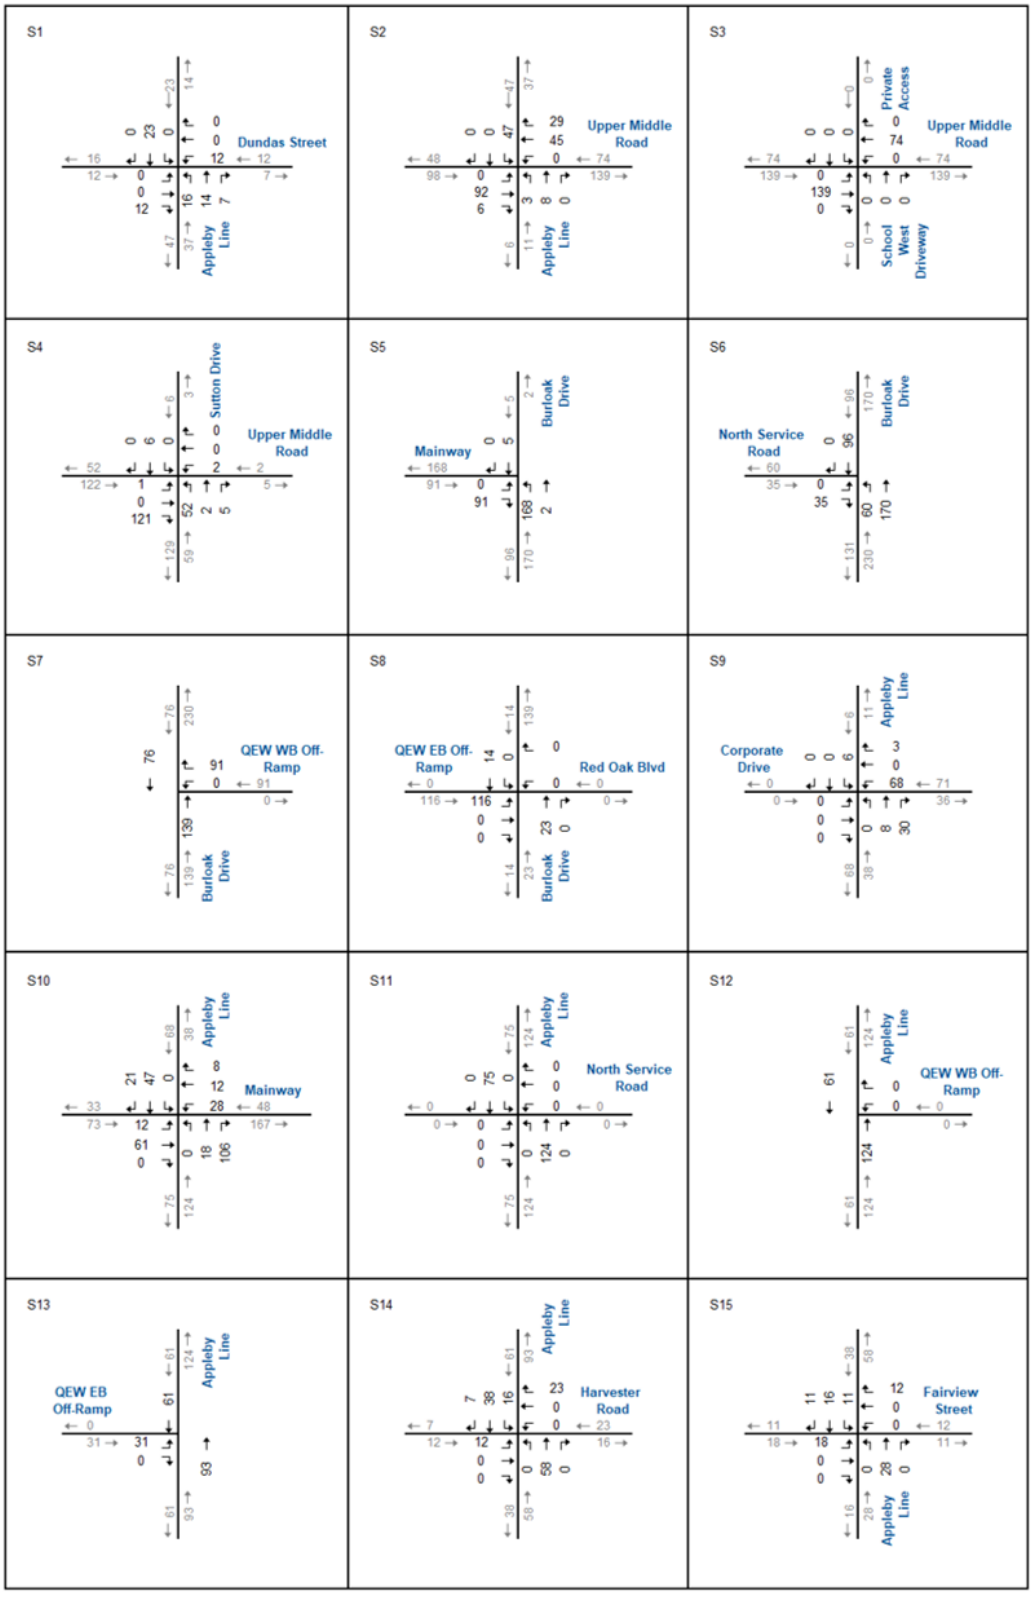
Vehicle trips generated by the subject site are distributed across the existing road and proposed road network. Vehicle trips are expected to be attracted to Provincial Highway Network (that is, QEW), areas within the city (for example, the Appleby Line MTSA) and to areas outside the Region via the existing Regional Road network (for example, Town of Milton or the north Oakville or Waterdown areas).

A significant portion of trips to/from the west are assumed to use Mainway and Upper Middle Road based on the roadway design and classification. Local trips are assumed to utilize Mainway as a large portion of the site's institutional and employment land use are centralized along Mainway, a four-lane industrial connector road. The remaining east/west local trips are expected to utilize Upper Middle Road or Dundas Street. Dundas Street is expected to be used less than Upper Middle Road and Mainway as traffic volumes disburse further away from the subject site.

The arterial road network of Appleby Line and Burloak Drive will distribute northbound and southbound trips, and all trips attracted to the provincial highway network. Most trips using the provincial highway network are assumed to use the Burloak Drive interchange as it provides the most direct connection to the site. Local delays on the provincial highway network may push drivers towards other interchanges and the wider arterial network in an effort to avoid actual

[12] Transportation Tomorrow Survey 2016, University of Toronto Data Management Group.

or perceived delays based on day-to-day operations along the highway.



Site generated trips are assigned to the network based on the considerations noted above.

Trip assignment starts with an “all or nothing” methodology meaning that all trips from an origin/destination will follow the fastest route (under uncongested conditions). This provides a conservative assessment of the road network operations. Based on input from the City and Region, alternative routing to avoid congestion has been considered. As the network becomes more congested, alternate routes may become faster and vehicles may divert to save time. While the majority of vehicles are assumed to take the “all or nothing” route, it is assumed that a portion of trips will divert to alternative routes to save time.

The new connection to Corporate Drive over Sheldon Creek is not expected to be used by a large amount of site traffic. With the proposed layout of the site, the majority of the parcels have more convenient access to higher-order roads (Upper Middle Road, Burloak Drive, and Mainway). Within the site, there are approximately 100-150 residential units along Corporate Drive, west of Sutton Road, where travelling across the new connection may be a shorter distance than using Mainway or Upper Middle Road. However, Corporate Drive is classified as a Neighbourhood Connector with a slower speed limit and multiple all-way stop controlled intersections. The Corporate Drive connection may serve as an alternative route to congested intersections for a subset of site trips but is not expected to serve a primary route for the large amount of site traffic.

4 Future Conditions

The assessment of future conditions in this section includes the following components:

- Background traffic forecast;
- Total traffic forecast;
- Level of service analysis for background traffic (pre-development); and
- Level of service analysis for total traffic (post-development).

Three horizon years have been assessed in this study: Proposed Opening year of the Phase 1 development (Year 2035), Five-years from the assumed opening date of the development (Year 2040), and Ten-years from the assumed opening date of the development (Year 2045). A longer-term analysis for the Full Build-Out is provided in **Section 7**.

4.1 Future Road Network

The City of Burlington Integrated Mobility Plan[13] (IMP) and Halton Region TMP[14] identify that Burloak Drive and Upper Middle Road are to be widened between QEW and Appleby Line from four to six lanes and convert the curb lanes to high occupancy vehicle (HOV) or bus rapid transit (BRT) lanes after completion of the road widening. These modifications are also expected to be applied to Appleby Line between Fairview Street and Taywood Drive.

Based on Halton Region's budget and business plan[15], the widenings are expected to be complete by 2031 and have been included in the background and total traffic analysis.

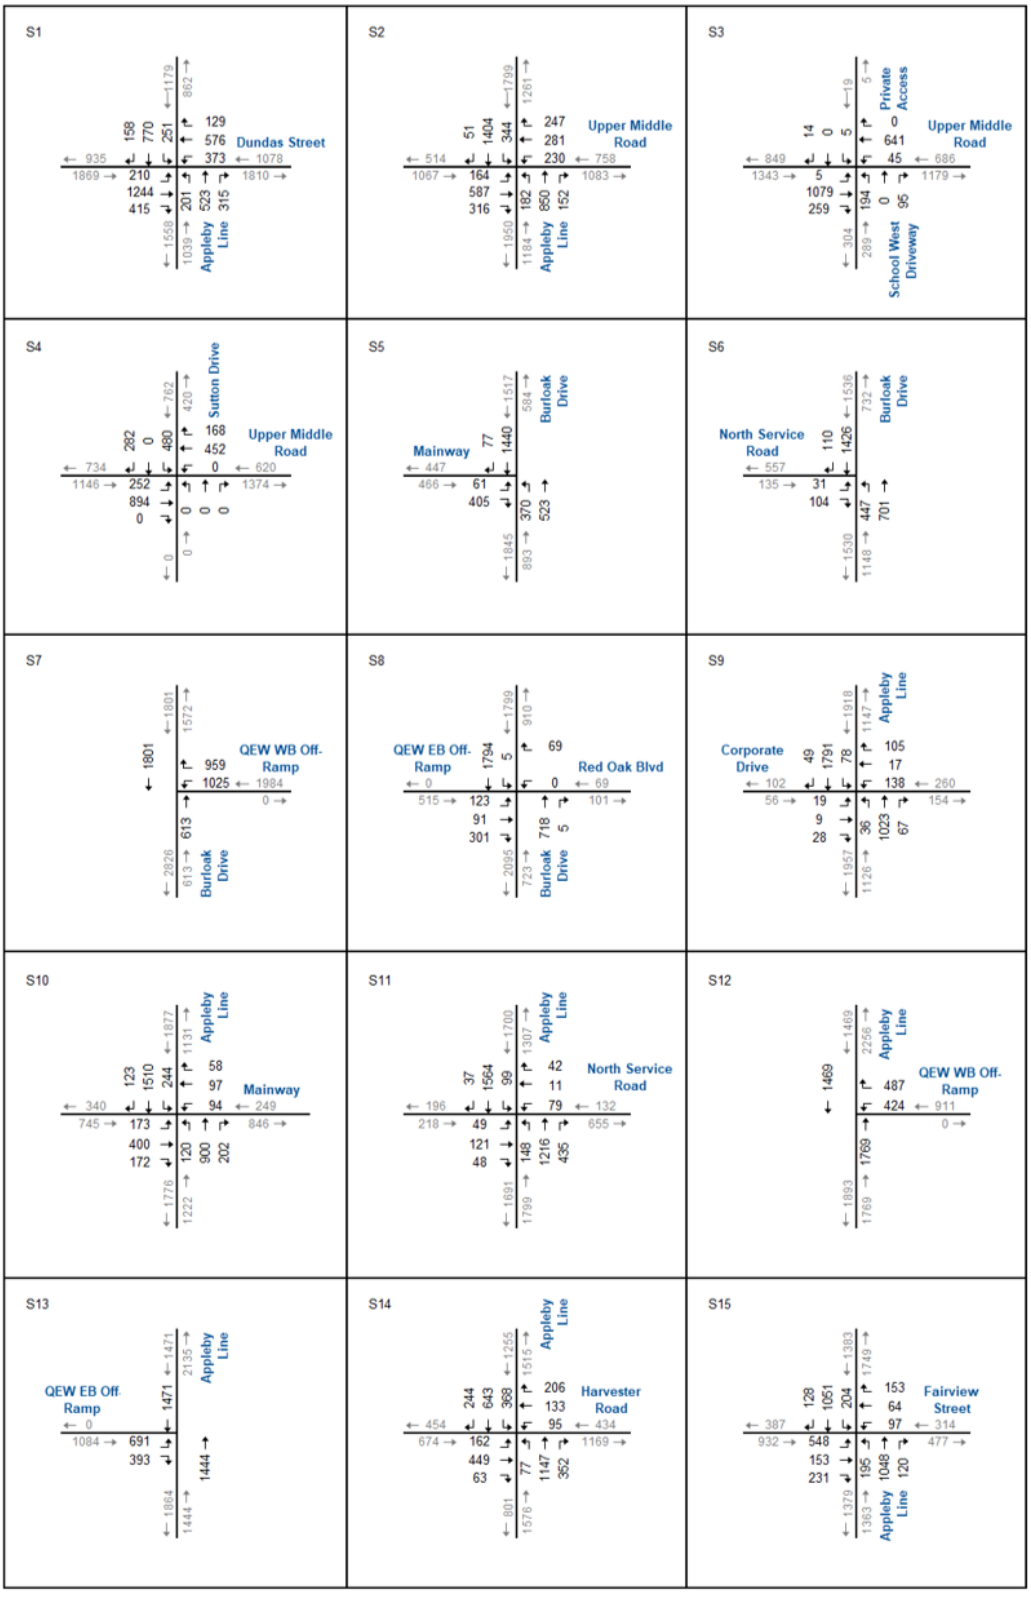
4.2 Forecast Traffic Volumes

Future traffic volumes near the subject site are estimated to consist of:

- Generalized compound annual traffic growth, as identified during pre-study consultation;
  - Burloak Drive north of Mainway: 4% per annum to 2031 and then 1% per annum from 2031 to 2045

[13] City of Burlington, Integrated Mobility Plan, September 2023
[14] Halton Region, Appendix E - Transportation Master Plan to 2031, October 2011
[15] Halton Region, Budget and Business Plan 2024-2033

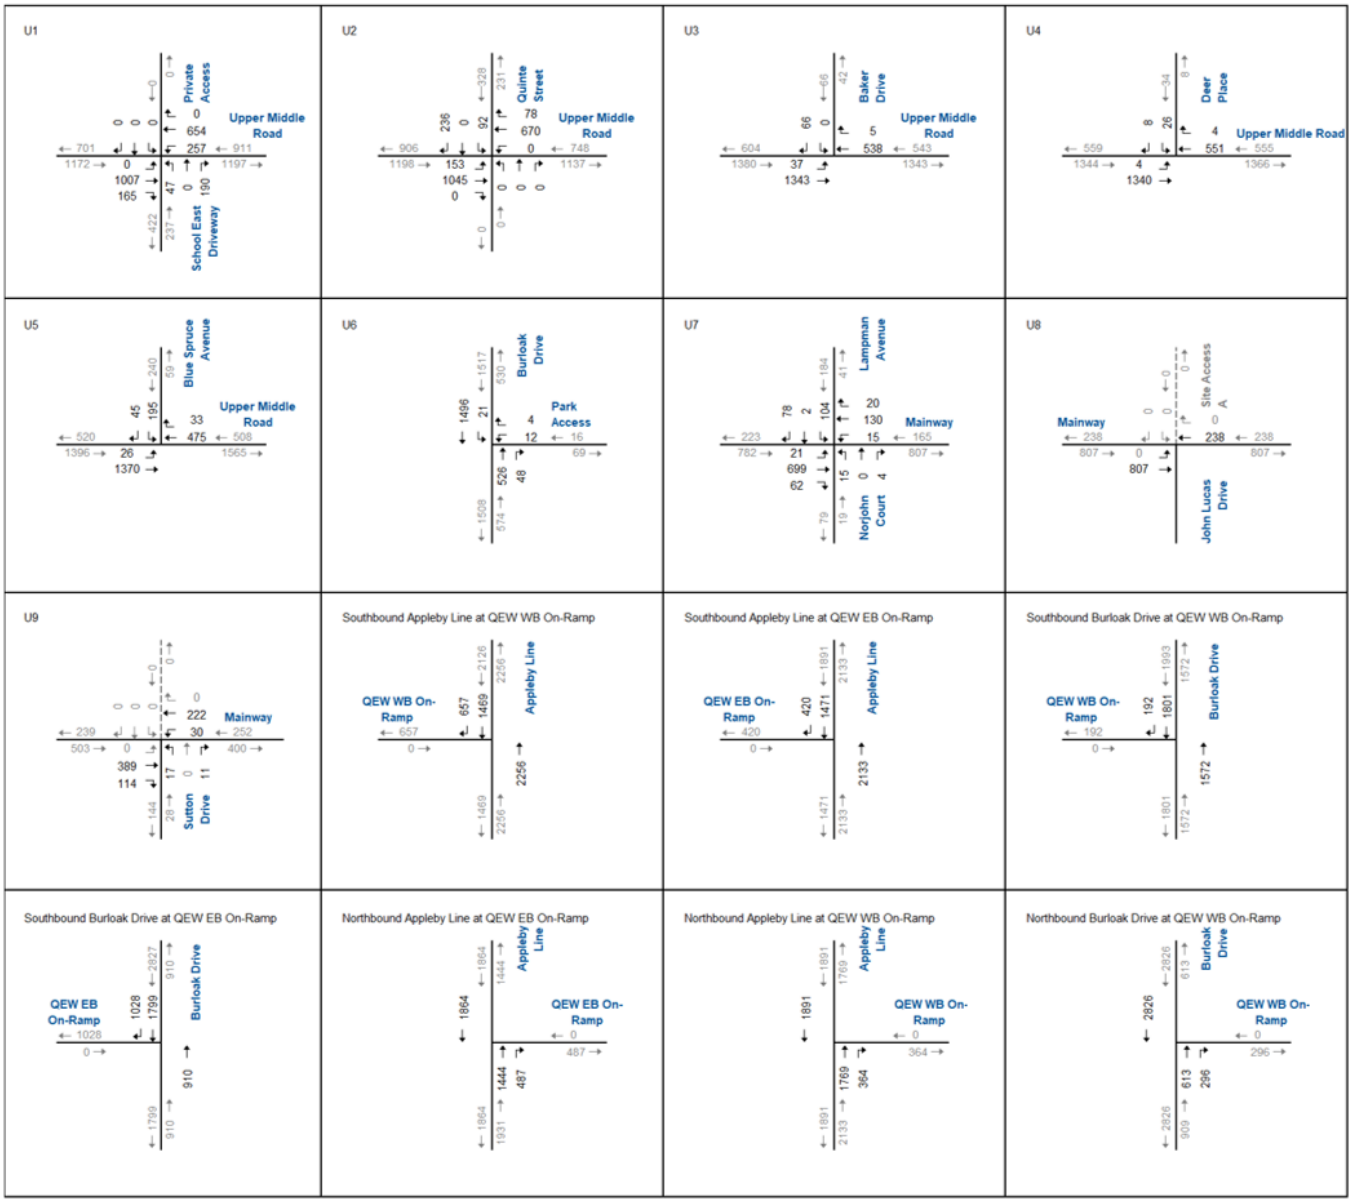
  - Upper Middle Road west of Burloak Drive: 4% per annum to 2031 and then 1% per annum from 2031 to 2045
  - Appleby Line at Upper Middle Road: 2% per annum to 2031 and then 1% per annum from 2031 to 2045
  - Fairview Street: 2% per annum
  - All other City of Burlington roadways: 1% per annum
  - QEW at Burloak Ramp: 3.5% per annum;
  - QEW at Appleby Line: 3.3% per annum; and
- Site-traffic contributions generated by the following other area background developments:
  - **2273 Turnberry Road** – 67 townhouse units.
  - **1989 Appleby Line** – two 20-storey residential buildings with a shared six-storey podium and ground floor retail. Approximately 475 residential units and 871 m^2 of ground floor retail are proposed.
  - **5030-5045 Tico Creek** – 108-unit hotel, a 558 m^2 mixed use building with restaurant and retail uses, and a 293 m^2 building with retail and fast-food restaurant
  - **Millcroft Greens** – 90 single detached units and a six-storey condominium building with 130 units.
  - **5219 Upper Middle Road** – two single detached units, four semi-detached units, and 14 townhouse units.
  - **1860-1900 Appleby Line**- an 18-storey building and two 16-storey buildings with a total of 560 residential units, 1,581 m^2 of retail space, and 1,820 m^2 of office space.
- Traffic generated by the subject site.



The future traffic volumes are illustrated in the following figures:

- **Figure 4.1A-F** illustrates the 2035 background traffic volumes.
- **Figure 4.2A-F** illustrates the 2035 total traffic volumes.
- **Figure 4.3A-F** illustrates the 2040 background traffic volumes.
- **Figure 4.4A-F** illustrates the 2040 background traffic volumes.
- **Figure 4.5A-F** illustrates the 2045 background traffic volumes.
- **Figure 4.6A-F** illustrates the 2045 total traffic volumes.

Appendix I contains a full network diagram showing the future traffic volumes. It is noted that as varying growth rates have been identified



by the City, Region, and MTO, some discrepancies in volumes may occur between intersections.

5 Operational Assessment

5.1 Level of Service Criteria

Intersection level of service (LOS) is a recognized method of quantifying the efficiency of traffic flow at intersections. It is based on the delay experienced by individual vehicles executing the various movements. The delay is related to the number of vehicles desiring to make a movement, compared to the estimated capacity for that movement. The capacity is based on several criteria related to the opposing traffic flows. The highest possible rating is LOS A, under which the average total delay is equal or less than 10.0 seconds per vehicle. When the average delay exceeds 80 seconds at signalized intersections (50 seconds at unsignalized), the movement is considered to have a LOS F and remedial measures are usually implemented if they are feasible.

The operations of the study area intersections were evaluated under existing traffic volumes using Synchro 12 and HCM 2000 procedures. The intersection analysis considered the following measures of performance:

- The LOS for each turning movement. LOS is based on the average control delay per vehicle;
- The volume to capacity ratio (v/c) for each intersection; and
- 95th percentile queue length (metres) using Synchro.

Under The Halton Region's TIS Guidelines[16], the following criteria indicate critical conditions and signify that mitigation measures may need to be considered:

- At signalized intersections,
  - Movements increased to v/c 0.85 or above; and
  - Movements increased to v/c 0.95 or above for exclusive turning movements.
- At unsignalized intersections,
  - LOS, based on average delay per vehicle, on individual movements is expected to operate at a LOS "D" or worse.
- At all intersections,

[16] Halton Region, Transportation Impact Study Guidelines, January 2015

- An exclusive turning movement in which the 95th percentile queue will exceed the available storage space.

The MTO's Traffic Impact Study Guidelines[17] identifies the following thresholds for critical movements:

- Movements with a volume to a capacity ratio greater than 0.85 at signalized intersections; and
- A volume to a capacity ratio greater than 0.75 for all ramp terminals approaches.

5.2 Intersection Capacity Analysis

Intersection capacity analyses were conducted at all intersections in the study area. Analyses were conducted for the Base Conditions (2024), Opening-Year (2035 Background and Total Conditions), Five Year after Opening (2040 Background and Total Conditions), and the Ten Year after Opening (2045 Background and Total Conditions).

Tables 5.1 – 5.26 summarize the capacity analyses for the study area intersections for all horizon years. The capacity analysis results are included in **Appendix J**. The following sub-sections outline the operations of the study area intersections.

5.2.1 Appleby Line at Dundas Street

Horizon Year	Operations
2024 Base Year	Approaching Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of Appleby Line and Dundas Street, all movements experience delays approaching critical conditions, with some movements operating at LOS F but v/c ratios below 0.80.

With Background traffic growth, the northbound through and left movement is forecast to operate at LOS E with a v/c ratio over 0.95 under the 2035 Background horizon during the weekday PM peak hour. During the Saturday peak hour, the westbound left-turn lane is forecast to operate in the LOS F range with a v/c ratio exceeding 1.00.

[17] Ministry of Transportation Ontario, General Guidelines for the Preparation of Traffic Impact Studies, March 2023

The northbound left-turn lane is also expected to degrade to LOS E with a v/c ratio of 0.95 by the 2040 horizon. Under the 2045 Background horizon, the westbound left-turn lane is projected to operate at LOS F with a v/c ratio exceeding 0.95 during the weekday AM peak hour. The southbound through lane is also anticipated to experience a LOS E with v/c ratios of 0.85 or greater during the weekday peak hours.

Under the 2040 Total horizon, delays are forecast in the westbound left-turn lane during the weekday AM peak hour, operating at LOS F with a v/c ratio of 0.95, as well as the southbound through lane during the weekday PM peak hour, operating at LOS E with a v/c ratio greater than 0.85. All other movements that experience critical movements under the Background horizons are expected to continue in the Total horizons.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Northbound through (v/c > 0.85) (2035 Background);
- Westbound left (v/c > 0.95) (2035 Background)
- Northbound left (v/c > 0.95) (2035 Total); and
- Southbound through (v/c > 0.85) (2040 Total).

5.2.2 Appleby Line at Upper Middle Road

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of Appleby Line and Upper Middle Road, the eastbound through-right lane operates at LOS E with a v/c ratio exceeding 0.85 during the weekday AM peak hour. During this time, critical movements also occur in the southbound left-turn lane, with the 95th percentile queues exceeding the available storage by less than 50 m, as well as the through-right lane operating with a v/c ratio of 0.95. During the weekday PM peak hour, critical movements are present in the eastbound left, westbound through, westbound right, and southbound left-turn lanes, with 95th percentile queues exceeding the available storage by less than 20 m, 40 m, and 30 m respectively. The westbound through movement operates in the LOS E range with v/c ratios of over 0.90. During the Saturday peak hour, the southbound left-turn lane is also expected to exceed the available storage by less than 25 m.

Background traffic growth is anticipated to significantly increase delays for the existing critical movements. Under the 2035 Background Horizon, the westbound left-turn lane is forecast to operate at LOS F with a v/c ratio greater than 1.00 during the weekday AM peak hour. The northbound through-right lane is also forecast to operate at LOS C with a v/c ratio exceeding 0.85. The northbound through-right lane is also expected to experience an LOS B with a v/c ratio of 0.85 during the weekday PM peak hour. During the Saturday peak hour, the eastbound left and westbound right turn lanes are also expected to experience 95th percentile queues that extend beyond the available storage by less than 30 m. During this time, the westbound left-turn lane is also projected to degrade to LOS F with a v/c ratio greater than 0.95.

Under the 2040 Total horizon, the northbound left-turn lane is forecast to operate at LOS F with a v/c ratio of 0.95 during the weekday AM peak hour. The eastbound through-right is also anticipated to operate at LOS E with a v/c ratio over 0.85 during the weekday PM peak hour. During the Saturday peak hour, the northbound and southbound

through-right lanes are expected to operate with v/c ratios of 0.85 or greater.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Eastbound left (v/c > 0.95; 95th queue) (2024 Existing);
- Eastbound through-right (v/c > 0.85) (2024 Existing);
- Westbound through (v/c > 0.85) (2024 Existing);
- Westbound right (v/c > 0.85; 95th queue) (2024 Existing);
- Southbound left (95th queue) (2024 Existing);
- Southbound through-right (v/c > 0.85) (2024 Existing).
- Westbound left (v/c > 0.95) (2035 Background);
- Northbound through-right (v/c > 0.85) (2035 Background); and
- Northbound left (v/c > 0.95) (2040 Total).

2040 Background	Within Capacity
2040 Total	Within Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Individual movements at the intersection of the Corpus Christi High School West Driveway and Upper Middle Road currently operate at LOS D or better during the weekday peak hours. Under the Background conditions, the intersection is expected to operate at similar levels to the base year conditions. Critical movement is noted in the 2045 Background horizon in the northbound through-left lane operating at LOS E with a v/c ratio of 0.85 during the weekday AM peak hour.

Under the 2045 Total horizon, the eastbound through-right lane is forecast to worsen, operating at LOS D with a v/c ratio greater than 0.85 during the weekday AM peak hour.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Northbound through-left (v/c > 0.85) (2045 Background); and
- Eastbound through-right (v/c > 0.85) (2045 Total).

5.2.4 Upper Middle Road at East School Driveway

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of the Corpus Christi High School East Driveway and Upper Middle Road, the northbound left-turn lane currently operates at LOS F and LOS D during the weekday AM and PM peak hours respectively. The southbound approach is a private driveway to Upper Middle Road. All other lanes operate at acceptable conditions at LOS B or better.

With background traffic growth, the northbound left-turn lane is forecast to continue operating at LOS F with significant delays during the weekday AM peak hour. All other intersections operate at similar levels of service to the base year condition. Under the 2040 Background horizon, the westbound left-turn lane is forecast to operate at LOS C with a 95th percentile queue exceeding the available storage by 5 m.

The addition of site-generated traffic under the Total horizon is forecast to significantly increase delays in the northbound left-turn lane to critical levels during the weekday AM peak hour and degrade the movement to LOS F for the weekday PM peak hour. Under the 2035 Total horizon, the westbound left-turn lane is projected to have a 95th percentile queue length exceeds the available storage by less than 5 m.

The increase in northbound delays results from the growth in eastbound/westbound traffic along Upper Middle Road, leaving fewer gaps for northbound turning movements.

Critical Movements (LOS D or worse)

- Northbound left (LOS > D) (2024 Existing); and
- Westbound left (95th queue) (2035 Total).

5.2.5 Upper Middle Road at Quinte Street

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of Upper Middle Road and Quinte Street, the southbound left-turn movement presently operates at LOS F during the AM peak hour with a v/c ratio greater than 1.00. All other movements are noted to be operating at LOS C or better during the weekday and Saturday peak hours.

Under the Background scenarios, the southbound left-turn lane is expected to continue operating at LOS F during the weekday AM peak hour with a significant increase in delays and a v/c ratio of over 3.00. Under the 2035 Background horizon, the southbound left-turn lane is also projected to degrade to LOS E-D during the weekday PM and Saturday peak hours respectively, with increased delays from background traffic growth. All other movements are expected to operate at acceptable levels of service.

Under the Total conditions, Quinte Street is proposed to extend south of Upper Middle Road to provide access to the development. With site-generated traffic volumes, the northbound and southbound movements are forecast to operate at LOS F with v/c ratios exceeding 1.00 and critical delays due to high traffic volumes during the weekday peak hours.

As one of the primary accesses to the subject site is proposed at this intersection, an increase in delay is expected. Improvements to the intersection will be required to accommodate the increase in vehicle traffic such as signalization and exclusive turn lanes.

Critical Movements (LOS D or worse)

- Southbound left (LOS > D) (2024 Existing)
- Northbound approach (LOS > D) (2035 Total)

5.2.6 Upper Middle Road at Sutton Drive

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At Upper Middle Road at Sutton drive, critical movement occurs in the southbound left-right lane, operating at LOS E with a v/c ratio over 1.00 during the weekday AM peak hour.

Under the 2035 Background horizon, the eastbound left-turn lane is forecast to degrade to LOS F during the weekday PM peak hour, with a v/c ratio exceeding 1.00 and queues extending beyond available storage by less than 35 m. During the same period, the westbound through-right lane is expected to operate at LOS C with a v/c ratio over 0.85. In the weekday AM peak hour, the southbound approach is anticipated to degrade to LOS E, with a v/c ratio greater than 1.00. By 2040, the eastbound left-turn lane is also expected to degrade to LOS E during the weekday AM peak hour, with a v/c ratio over 1.00. Additionally, the southbound left-right turn lanes are forecast to operate at LOS E with a v/c ratio exceeding 0.85 during the weekday PM peak hour.

Under the Total conditions, Sutton Drive is proposed to extend south of Upper Middle Road to provide access to the subject lands. Under the 2035 Total horizon, the southbound approach is projected to degrade to LOS F and LOS D during the weekday PM and Saturday peak hours respectively, with v/c ratios exceeding 0.85.

As one of the primary accesses to the subject site, an increase in delay is expected. Improvements to the intersection will be required to accommodate the increase in vehicle traffic such as additional turn lanes and dedicated signal phases.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Southbound movement (v/c > 0.85) (2024 Existing);
- Eastbound left (v/c > 0.95) (2035 Background); and
- Westbound through-right (v/c > 0.85) (2035 Background).

At Upper Middle Road at Deer Place, the southbound approach operates at LOS D during the weekday PM peak hour.

Under the 2045 Background horizon, the southbound approach is forecast to degrade to LOS D during the weekday AM peak hour with a minor increase in delays from background traffic growth.

Total conditions operate similar to background with only a minor increase in delay resulting from site traffic.

Critical Movements (LOS D or worse)

- Southbound movement (LOS > D) (2024 Existing).

5.2.9 Upper Middle Road at Blue Spruce Avenue

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Individual movements at the intersection of Upper Middle Road and Blue Spruce Avenue presently operate at LOS C or better. The exception is the stop-controlled southbound approach, with a LOS D-F during the weekday and Saturday peak hours.

Under the 2035 Background horizon, the eastbound left-turn lane is expected to degrade to LOS D during the weekday PM peak hour. The southbound approach is also forecast to further degrade to LOS F during the weekday and Saturday peak hours with v/c ratios exceeding 1.00 due to increased delays from eastbound/westbound traffic growth along Upper Middle Road.

Total conditions operate similar to background with only a minor increase in delay resulting from site traffic.

Critical Movements (LOS D or worse)

- Southbound movement (LOS > D) (2024 Existing); and
- Eastbound left (LOS > D) (2035 Background)

5.2.10 Burloak Drive at Bronte Creek Park Access

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of Burloak Drive at Bronte Creek Park Access, the westbound approach currently operates at LOS F during the weekday PM peak hour, with delays of less than 70 seconds.

Under the 2035 Background horizon, the westbound approach is forecast to degrade to LOS F during the Saturday peak hour. The southbound left-turn is also projected to experience delays in the LOS D range under the 2040 Background horizon and is expected to deteriorate further with the future background growth during the weekday PM peak hour. The weekday AM peak hour will also see the westbound approach operate at LOS D, and is expected to continue experiencing high delays under future Total scenarios.

Total conditions operate similar to background with only a minor increase in delay resulting from site traffic.

Critical Movements (LOS D or worse)

- Westbound movement (LOS > D) (2024 Existing);
- Southbound left (LOS > D) (2040 Background).

5.2.11 Burloak Drive at Mainway

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Individual movements at Burloak Drive and Mainway intersection presently operate at acceptable conditions, with a LOS D or better for all movements.

With background traffic growth, the northbound left-turn lane degrades to a LOS F with a v/c ratio exceeding 1.00 during the weekday AM and PM peak hours, with queue lengths exceeding the available storage by less than 105 m and 235 m respectively. The eastbound right-turn lane is also projected to experience critical delays at LOS F and v/c ratio grater than 0.95 during the weekday AM peak hour.

Under the 2035 Total conditions, the eastbound right-turn lane is also anticipated to operate in the LOS F range with a v/c ratio exceeding 1.00 and significant delays resulting from site-generated traffic, during the weekday PM peak hour. By 2045 Total scenario, northbound left-turn queues are forecast to extend up to 380 m and eastbound right-turn queues are forecast to extend up to 220 m.

Mainway is forecast to be the primary road to access the institutional and employment lands located on the south end of the subject site. As one of the primary accesses to the subject site, an increase in delay is expected along the Mainway corridor.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Eastbound right (v/c > 0.95) (2035 Background); and
- Northbound left (v/c > 0.95; 95th queue) (2035 Background).

5.2.12 Mainway at Sutton Drive

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At Sutton Drive and Mainway, individual movements during the weekday peak hour operate at acceptable conditions, with a LOS C or better for all movements.

Under the 2035 Background horizon, the northbound approach will likely operate in the LOS E range and degrade under future horizons with background traffic and development.

As Sutton Drive is expected to provide access to the development under the Total conditions, the site-generated traffic increases delays for southbound and northbound movements. The southbound and northbound approaches under the 2035 Total horizon is forecast to operate at LOS F during the weekday peak hours, with significant delays and v/c ratios greater than 0.85.

Critical Movements (LOS D or worse)

- Northbound movement (LOS > D) (2035 Background); and
- Southbound movement (LOS > D) (2035 Total).

At the intersection of Norjohn Court/Lampman Avenue at Mainway, critical movements are present in the northbound approach during the weekday peak hour, operating at LOS D-E. The southbound approach also experiences critical delays, operating at LOS E during the weekday PM peak hour.

Delays at these movements are expected to worsen with the addition of future background growth and site generated traffic under future Background and Total horizons.

Critical Movements (LOS D or worse)

- Northbound movement (LOS > D) (2024 Existing); and
- Southbound movement (LOS > D) (2024 Existing).

5.2.14 Appleby Line at Mainway

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of Appleby Line and Mainway, the westbound through-right, and northbound left-turn lanes currently operate in the LOS F range with v/c ratios of 1.00 or greater during the PM peak hour. The northbound left-turn lane exceeds the available storage by less than 25 m during this time. The northbound through-right lane also exhibits a LOS C with a v/c ratio greater than 0.85

Under the 2035 Background horizon the eastbound left-turn lane is forecast to experience significant delays at LOS F with a v/c ratio exceeding 1.00 during the weekday PM peak hour. The 95th percentile queue for this movement is also anticipated to exceed the available storage by less than 15 m. Under the 2040 Background horizon, the eastbound through-right lane is projected to operate at LOS E with a v/c ratio greater than 0.85 during the weekday AM peak hour. The 95th percentile queue for this movement is also anticipated to extend 190 m and exceed the available storage by less than 95 m.

Under the 2035 Total conditions, the eastbound through-right is anticipated to experience critical delays ranging from LOS E during the weekday AM peak hour with a v/c ratio over 0.85. Under the 2040 Total horizons, the southbound left-turn lane is projected to have queues exceeding storage by less than 5 m, as well as a through-right lane with a v/c ratio over 0.85. Under the 2045 Total horizon, the westbound left-turn lane is expected to experience a LOS F with a v/c ratio over 0.95 during the weekday AM peak hour, and a 95th percentile queue exceeding storage by less than 10 m during the weekday PM peak hour.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Westbound through-right (v/c > 0.85) (2024 Existing);
- Northbound left (v/c > 0.95; 95th queue) (2024 Existing);
- Northbound through-right (v/c > 0.85) (2024 Existing);

- Eastbound left (v/c > 0.95; 95th queue) (2035 Background);
- Eastbound through-right (v/c > 0.85) (2035 Total);
- Westbound left (v/c > 0.95) (2045 Total);
- Southbound left (v/c > 0.95; 95th queue) (2040 Total); and
- Southbound through-right (v/c > 0.85) (2040 Total).

5.2.15 Appleby Line at Corporate Drive

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Approaching Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Individual movements at the intersection of Appleby Line at Corporate Drive presently operate within capacity, with a LOS E or better for all movements and v/c ratios less than 0.85. Similar levels are projected under the future Background horizons to the existing conditions.

Under the 2040 Background horizon, the westbound approach is forecast to operate at LOS E with a v/c ratio of 0.85, during the weekday PM peak hour.

Under the 2035 Total horizon, the westbound approach is projected to operate in the LOS E-F range during the weekday peak hours with a v/c ratio of 0.90. or greater. This movement is also expected to degrade in the Saturday peak hours to a LOS E with a v/c ratio of 0.85 by the 2040 Total horizon. The northbound through-right lane is anticipated to operate with a v/c ratio over 0.85 during the weekday PM peak hour under the same scenario.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Westbound movement (v/c > 0.85) (2035 Total); and
- Northbound through-right (v/c > 0.85) (2040 Total).

2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under existing conditions, various movements exhibit delays in the LOS E range or better, however, no critical movements are noted.

With background traffic growth, the northbound left-turn lane will degrade to LOS F with v/c ratios greater than 1.00 under the 2035 Background horizon during the weekday AM peak hour. The eastbound right-turn lane is forecast to degrade to LOS F with a v/c ratio greater than 0.95 under the 2040 Background horizon during the weekday PM peak hour.

Under the 2035 Total, the eastbound right-turn lane is forecast to degrade to LOS F with a v/c ratio greater than 1.00 during the weekday PM peak hour. Furthermore, under the 2045 Total horizon, the northbound through lane is anticipated to operate with a v/c ratio of 0.85 during the weekday PM peak hour.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Northbound left (v/c > 0.95) (2035 Background);
- Eastbound right (v/c > 0.95) (2035 Total); and
- Northbound through (v/c > 0.85) (2045 Total).

5.2.17 Burloak Drive at QEW WB Off-Ramp

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of Burloak Drive at the QEW Westbound Off-ramp, the westbound left-turn lane operates in the LOS E-F range with a v/c ratio greater than 1.00 during the weekday and Saturday peak hours. The westbound right-turn lane exhibits LOS F during the PM peak hour, with v/c ratios exceeding 1.00 and the right-turn lane queue exceeding the available storage by less than 180 m. Ramp queues are not expected to reach the bullnose, located approximately 450 m, and do not spill back to the mainline.

With the addition of background traffic growth, under the 2035 Background horizon, operations at the westbound right-turn lane are forecast to degrade to LOS F with a v/c ratio greater than 1.00, as well as queues exceeding the available storage by less than 70 m during the weekday AM peak hour, and by less than 100 m during the Saturday peak hour. The southbound approach during this scenario is also expected to operate at LOS D with a v/c ratio greater than 1.00 during the weekday PM peak hour.

Under the 2040 Background horizon, the southbound approach is projected to operate with a v/c ratio over 0.85 during the weekday AM peak hour. The northbound through-lane is also anticipated to operate with a v/c ratio over 0.85 during the weekday PM peak hour under the 2045 Background horizon. The westbound ramp left and right-turn 95th percentile queue lengths are forecast to extend between 325 and 865 m back during the peak hours and are forecast to spill back to the mainline.

Delays forecast under the future Background horizons are anticipated to worsen with the addition of site-generated traffic volumes but no new critical movements are expected as a result.

<u>Critical Movements</u> (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, v/c over 0.75 for ramp approaches, 95th Percentile queues over storage)

- Westbound left (v/c > 0.75) (2024 Existing);
- Westbound right (v/c > 0.75; 95th queue) (2024 Existing);
- Southbound movement (v/c > 0.85) (2035 Background); and
- Northbound movement (v/c > 0.85) (2045 Background).

5.2.18 Burloak Drive at QEW EB Off-Ramp/Red Oak Boulevard

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Individual movements at the intersection of Burloak Drive at the QEW Eastbound Off-Ramp presently operate at acceptable conditions, with a LOS D or better for all movements.

Under the 2035 Background horizon, the southbound approach is forecast to experience with a v/c ratio greater than 0.90 during the weekday PM peak hour. This movement is also forecast to degrade to critical levels during the weekday AM and Saturday peak hours under the 2045 Background horizon, operating in the LOS C-E range respectively with v/c ratios greater than 1.00.

With the addition of site-generated traffic, under the 2035 Total horizon, the eastbound left-turn lane will exhibit delays in the LOS D range with a v/c ratio over 0.75 during the weekday AM peak hour. Furthermore, under the 2040 Total horizon, the southbound approach is projected to experience delays of LOS C with a v/c ratio greater than 0.85 during the weekday AM and Saturday peak hour.

Critical Movements (v/c over 0.85, v/c over 0.75 for ramp approaches)

- Southbound movement (v/c > 0.85) (2035 Background); and
- Eastbound left (v/c > 0.75) (2035 Total).

5.2.19 Appleby Line at North Service Road

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of Appleby Line at North Service Road, critical movements are exhibited in the westbound left-turn lane, operating at LOS F with a v/c ratio greater than 0.95 and queues exceeding the available storage by less than 40 m during the weekday PM peak hour.

Under the 2035 Background horizon, the westbound through-right and northbound left-turn lanes are projected to degrade to LOS D-E range with v/c ratios greater than 0.85 during the weekday PM peak hour. The northbound left-turn lane is anticipated to have queues exceeding the available storage by 20 m. The eastbound left-turn lane will also exhibit delays in the LOS F range with queues exceeding storage by less than 5 m during this time.

With the addition of site-generated traffic, under the 2035 and 2045 Total horizons, the northbound through-right lane is forecast to operate with a v/c ratio greater than 0.85 during the weekday AM and PM peak hours.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Westbound left (v/c > 0.95; 95th queue) (2024 Existing);
- Westbound through-right (v/c > 0.85) (2035 Background);
- Northbound left (95th queue) (2035 Background);
- Eastbound left (95th queue) (2035 Background); and
- Northbound through-right (v/c > 0.85) (2035 Total).

5.2.20 Appleby Line at QEW WB Off-Ramp

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of Appleby Line at the QEW Westbound Off-Ramp, critical movements occur in the westbound right-turn lane, operating at LOS F with a v/c ratio greater than 1.00 during the weekday PM peak hour. Westbound ramp queues are not expected to reach the bullnose, located approximately 500 m, and do not spill back to the mainline.

Under the 2035 Background horizon, the westbound left-turn lane is forecast to operate at LOS E with a v/c ratio exceeding 0.95 during the weekday PM peak hour. The westbound right-turn lane will also degrade to LOS F with a v/c ratio greater than 1.00 during the weekday AM peak hour.

Under the 2040 Background horizon, the northbound approach is forecast to operate with a v/c ratio exceeding 0.85 during the weekday PM peak hour. This movement is also forecast to exhibit critical movements during the AM and Saturday peak hours under the 2045 Background horizon. The southbound through lane is projected to operate with a v/c ratio greater than 0.85 during the weekday PM peak hour under the 2045 horizon.

Under the 2045 Background horizon, the westbound left and right-turn 95th percentile queue lengths are forecast to extend between 325 and 865 m back during the weekday PM peak hour and are forecast to spill back to the mainline.

With the addition of site-generated traffic, under the 2040 Total horizon, the northbound approach will operate with a v/c ratio exceeding 0.85 during the weekday peak hours. The southbound approach is expected to operate with a v/c ratio greater than 0.85 during the weekday peak hours, under the 2045 Total horizon.

<u>Critical Movements</u> (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Westbound right (v/c > 0.75) (2024 Existing);
- Westbound left (v/c > 0.75) (2035 Background);
- Northbound approach (v/c > 0.85) (2040 Background); and
- Southbound approach (v/c > 0.85) (2045 Background).

5.2.21 Appleby Line at QEW EB Off-Ramp

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Individual movements at the intersection of Appleby Line at the QEW Eastbound Off-Ramp presently operate at acceptable conditions, with a LOS E or better for all movements. The exception being the eastbound left-turn off-ramp movement which operates with a v/c of 0.75 during the weekday AM peak hour.

With background traffic growth, the eastbound right-turn is forecast to operate at critical levels under the 2035, 2040, and 2045 horizons during the weekday and Saturday peak hours. The 95th percentile queue is forecast to extend up to 125 m, beyond the available storage by less than 55 m, but is not expected to reach the bullnose located approximately 415 m away.

Under the 2035 Background horizon, the eastbound left-turn lane is forecast to operate with delays in the LOS E range and a v/c ratio greater than 0.75 during the weekday PM and Saturday peak hours. Under the 2040 and 2045 Background horizons, the southbound approach is projected to operate with a v/c ratio of over 0.90 during the weekday PM and AM peak hours respectively. The northbound approach is projected to operate at LOS B and a v/c ratio exceeding 0.90 during the weekday AM peak hour.

Critical movements identified during the Background horizons is expected to worsen under the future Total conditions with the addition of site generated traffic volumes

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, v/c over 0.75 for ramp approaches, 95th Percentile queues over storage)

- Eastbound left (v/c > 0.75) (2024 Base);
- Eastbound right (v/c > 0.75; 95th queue) (2035 Background);
- Southbound movement (v/c > 0.85) (2040 Background); and
- Northbound movement (v/c > 0.85) (2045 Background).

5.2.22 Appleby Line at Harvester Road

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements occur in the eastbound left-turn, westbound left, and westbound through-right lanes during the weekday PM peak hour, operating at LOS E–F with v/c ratios exceeding 0.90. Queues in the eastbound left-turn lane exceed available storage by less than 15 m, while the westbound left-turn lane exceeds storage by approximately 40 m. During the weekday AM peak hour, the southbound left-turn lane operates at LOS D, with queues exceeding available storage by about 40 m. During the Saturday peak hour, the westbound left-turn lane degrades to LOS F, with a v/c ratio greater than 1.00 and queues extending beyond available storage by less than 75 m.

With background traffic growth, critical operations are forecast for the eastbound through-right lane during the weekday PM peak hours, operating at LOS E with a v/c ratio greater than 0.85.

With the addition of site-generated traffic, under the 2045 Total horizon, the northbound through-lane is projected to operate with a v/c ratio exceeding 0.85 during the weekday AM peak hour. The southbound through-lane is also expected to operate with a v/c ratio greater 0.85 during the weekday PM peak hour.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Eastbound left (v/c > 0.95; 95th queue) (2024 Existing);
- Westbound left (v/c > 0.95; 95th queue) (2024 Existing);
- Westbound through-right (v/c > 0.85) (2024 Existing);
- Southbound left (95th queue) (2024 Existing);
- Eastbound through-right (v/c > 0.85) (2040 Background);
- Northbound right (95th queue) (2045 Background);
- Northbound through (v/c > 0.85) (2045 Total); and
- Southbound through (v/c > 0.85) (2045 Total).

5.2.23 Appleby Line at Fairview Street

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At the intersection of Appleby Line at Fairview Street, critical movements are present at the eastbound and southbound right-turn lanes, operating at LOS D and B with 95th percentile queue lengths exceeding the available storage by less than 10 m and 70 m, respectively during the weekday PM peak hour.

Under the 2035 Background horizon, critical movements are projected in the eastbound left-turn lane during the weekday peak hours, with queues exceeding the available storage by less than 5 m. During the weekday AM peak hour, the northbound through lane operates with a v/c ratio exceeding 0.90, while the southbound left-turn lane is forecast to experience queues that exceed the available storage by less than 15 m. During the weekday PM peak hour, the northbound left-turn lane is forecast to exhibit queues exceeding storage by less than 70 m. The southbound through-lane during the Saturday peak hour operates at LOS D with a v/c ratio greater than 0.90.

Under the 2040 Background horizon, critical movements are expected in the northbound left-turn lane during the weekday AM peak hour with queues exceeding storage by less than 15 m, as well as in the southbound through lane during the weekday PM peak hour with a v/c ratio greater than 0.90. During the Saturday peak hour, the eastbound right turn lane is expected to exceed storage by less than 10 m and the northbound through-lane to operate with a v/c ratio of 0.85.

Under the 2045 Background horizon, the southbound through lane is forecast to operate with a v/c ratio greater than 0.85 during the weekday AM peak hour. The eastbound right-turn lane is also expected to degrade to LOS E with queues exceeding storage by less than 5 m during the Saturday peak hour.

With the addition of site-generated traffic, critical movements that are identified under the Background horizons are anticipated to persist or worsen with the addition of site-generated traffic volumes under the future Total conditions.

<u>Critical Movements</u> (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Eastbound right (95th queue) (2024 Existing)
- Southbound right (95th queue) (2024 Existing)
- Eastbound left (95th queue) (2035 Background)
- Northbound left (95th queue) (2035 Background)
- Northbound through (v/c > 0.85) (2035 Background)
- Southbound left (95th queue) (2035 Background)
- Southbound through (v/c > 0.85) (2035 Background)

5.3 Internal Intersection Capacity Analysis

With Phase 1 of the development, Corporate Drive is proposed as the primary east-west roadway through the site to Sutton Drive. The road will potentially connect to the existing Corporate Drive leading to Appleby Line. The City has requested that the analysis assume the connection will be in place.

An analysis is completed using internal site traffic volumes generated by the different parcels within the development and routed through the network.

Table 5.25 summarizes the capacity analyses for the internal Sutton Drive at Corporate Drive intersection. The capacity analysis results are included in **Appendix J**.

5.3.1 Sutton Drive at Corporate Drive

Horizon Year	Operations
All Total Horizons	Within Capacity

At the all-way stop-controlled intersection of Sutton Drive at Corporate Drive, all approaches are forecast to operate within capacity with LOS A or better during the weekday and Saturday peak hours.

As per comments from the City, alternative traffic control is considered including signalization and roundabout configurations.

A signal warrant analyses was conducted at the proposed intersection to evaluate the potential benefits of signalization. **Appendix K** contains the signal warrant analysis. The forecast volumes do not warrant signalization.

With signalization, delays would increase slightly compared to the all-way stop control conditions, the intersection would continue to operate at an acceptable LOS B or better.

As the intersection is anticipated to operate with acceptable levels of service with all-way stop control and signalization, a qualitative assessment of a roundabout configuration is conducted. The internal site volumes are not forecast to warrant a signal.

A roundabout reduces points of vehicle conflict, promotes lower speeds, reduces collision severity, and has the potential to reduce vehicle delay. As intersection delays are forecast to be LOS B or better, introducing a roundabout would provide limited operational

benefit while requiring a greater right-of-way and higher costs compared to the proposed all-way stop control.

In addition, pedestrian crossing at the roundabout may be a concern. Although splitter islands can provide a refuge, the total walking distance is often increased at a roundabout. Pedestrian visibility and vehicles not yielding to pedestrians are common concerns with roundabouts.

All three intersection controls are expected to accommodate vehicle traffic without issue. Considering the land requirements and pedestrian crossings, an all-way stop controlled intersection control is recommended for Phase 1 of the development.

5.4 Appleby Line Corridor Analysis

Appleby Line is a north-south major arterial roadway with a six-lane cross section north of Taywood Drive, a four-lane cross-section at the Upper Middle Road intersection, and a five-lane cross-section south of Corporate Drive.

Appleby Line provides connection between the north end of Burlington, Highway 407, QEW, Appleby GO Station, and the Burlington waterfront (Appleby Place Window to the Lake).

Appleby Line is planned to be widened to six lanes between Fairview Street and Taywood Drive with the curb lanes converted to high occupancy vehicle (HOV) or bus rapid transit (BRT) lanes after completion of the road widening.

A corridor analysis has been conducted to assess the potential capacity constraints along Appleby Line, north of Dundas Street.

Arterial roads generally have a vehicle lane capacity of 900 vehicles per hour per lane (vph/ln). North of Dundas Street, Appleby Line has an approximate vehicle capacity of 2,700 vph per direction. With the planned conversion of the curb lane to HOV/BRT lanes, the vehicle capacity is expected to decrease. HOV lanes are reserved for vehicles with two or more occupants or electric/hybrid vehicles with a green license plate. It is assumed lane utilization would decrease to 0.80 to account for a lower number of vehicles meeting the criteria to use the HOV lane.

BRT lanes would be restricted to buses only and effectively decrease the vehicle capacity of the road to two lanes per direction. While both the HOV and BRT lane options decrease the vehicle capacity of the roadway, the person capacity of the roadway will increase by promoting and supporting higher occupancy modes of travel.

Table 5.26 outlines the directional capacity of Appleby Line and the forecast volumes for the peak direction of travel for each analysis period and horizon year.

Peak direction volumes on Appleby Line, north of Dundas Street currently range between 1,050 and 1,300 vph. With an estimated capacity of 2,700 vph, the v/c ratio for the corridor is less than 0.50 during the peak hours.

In the future horizons with the widening and HOV/BRT lanes, it is assumed that road capacity would decrease to 1,800-2,100 vph.

Background traffic growth is forecast to increase peak direction volumes to the 1,300-1,620 vph range and a v/c ratio of up to 0.90.

The addition of Phase 1 site traffic is forecast to increase peak direction volumes to the 1,320-1,670 vph range and a v/c ratio approaching 0.95.

With a conservative estimate of road capacity, the Appleby Line corridor north of Dundas Street is forecast to approach capacity with background traffic alone. The addition of site traffic decreases the potential available capacity for the peak direction.

However, it should be noted that multiple assumptions place this assessment on the conservative end of the forecast. This assessment assumes the third lane will be only utilized by buses, a high traffic growth rate (1-2% percent per annum) continues to 2045, and travel patterns and mode choice behaviour do not change.

If the lane operates as a HOV lane or bus lane and HOV lane, the capacity for the curb lane will increase. Automobile usage may shift to transit with network and service improvements, particularly with development around the Appleby GO MTSA.

TABLE 5.26: APPLEBY LINE CORRIDOR CAPACITY (NORTH OF DUNDAS STREET)

Horizon	Vehicle Capacity / Direction/ Hour	Peak Direction Volume (vph)			Volume/Capacity Ratio		
		AM	PM	Sat	AM	PM	Sat

6 Mitigation

The following sections discusses the intersection operations and potential remedial measures that could be considered to better accommodate the forecast traffic volumes in the study area.

6.1 Queuing Assessment

A queue assessment of the study area intersections was conducted to provide a more accurate assessment of the potential queues. SimTraffic was utilized rather than Synchro in this assessment as microscopic models, such as SimTraffic, individually track each vehicle in the traffic system through the model and collect comprehensive operational measures of effectiveness for every vehicle during each 0.1 second of the simulation. Unlike Synchro, SimTraffic measures the full impact of queuing and blocking. Synchro is best used to determine level of service and delay at the macro level but is not ideal for assessments simulating real-world conditions. The analysis consisted of five (5) iterations of sixty (60) minute simulations to forecast the delay per vehicle in seconds. **Appendix L** provides the SimTraffic results.

Table 6.1 – 6.3 summarizes the existing storage lengths and the forecast 95th percentile queue lengths under the existing year, 2045 background, and 2045 total conditions.

Extensive queues are forecast throughout the network in the 2045 horizon year.

The 95th percentile queues along Upper Middle Road, Burloak Drive, and Appleby Line are forecast to extend up to 630 m during the peak hours and impact the upstream intersections.

At QEW ramps, 95th percentile queues are forecast to extend beyond the bullnose and potentially impact highway operations in the Background and Total scenarios.

Along streets with high volumes of through traffic (Appleby Line, Mainway, Burloak Drive, Upper Middle Road), left and right-turn movements can be impacted by downstream congestion. SimTraffic accounts for vehicle congestion throughout the network which results in longer queues at intersections.

Traffic signals along Appleby Line, Upper Middle Road, and Burloak Drive are coordinated, meaning green times along corridor align to allow for groups of vehicles to potentially progress with reduced delay.

Under Existing conditions queues spill back to upstream intersections and block intersections. This congestion is forecast to continue with background traffic growth and the addition of site traffic. Signal coordination should be reassessed as traffic grows to improve progression and avoid the blockage of intersections.

The impact of queues at individual intersections and intersection modifications are discussed further in the following sections.

6.2 Left Turn Lanes

The proposed new unsignalized intersections within the study area were assessed to determine if the future traffic volumes warrant the installation of a left-turn lane along the major roadway.

The warrants for left-turn lanes follow the Ministry of Transportation's (MTO) Geometric Design Standards[18] requirements. A 10 km/h design speed over the posted and/or assumed speed limit has been utilized. The percentages of left-turning vehicles in the approaching volume were rounded to the nearest 5 percent, as nomographs are only provided for 5 percent increments. **Table 6.4** summarizes the results of the left-turn lane warrant analyses. **Appendix M** contains the nomographs used for each intersection. The following turn lanes are warranted:

- Sutton Drive at Mainway - Eastbound left-turn lane with 25 m of storage. Widening of Mainway east and west of Sutton Drive would be likely required to develop the turn lane; and
- Site Access A at Mainway - Eastbound left-turn lane with 15 m of storage. Widening of Mainway east and west of Site Access A would be likely required to develop the turn lane.

TABLE 6.4: LEFT-TURN LANE WARRANT SUMMARY

[18]MTO Design Supplement for TAC Geometric Design Guide for Canadian Road, 2023

6.3 Intersection Modifications

A sensitivity analysis has been conducted for the 2045 Total horizon to assess the intersection operations with intersection modifications, including adjusting cycle lengths, lane configurations, or traffic control.

As outlined in the City of Burlington IMP[19] and Halton Region TMP[20], Burloak Drive and Upper Middle Road are identified to be widened between QEW and Appleby Line from four to six lanes and convert the curb lanes to HOV/BRT lanes after completion of the road widening. These modifications are also expected to be applied to Appleby Line between Fairview Street and Taywood Drive.

The widenings are expected to be complete by 2031 and have been included in the background and total traffic analysis.

Table 6.5-6.7 summarizes the results of the sensitivity analysis. **Appendix N** contains the detailed Synchro reports.

Signal warrant analyses were conducted on the study area intersections to determine if the projected traffic conditions would warrant improvements to traffic control. The signal warrant is based on the Ontario Traffic Manual (OTM) Justification 7[21]. The signal warrant analysis is provided in **Appendix K.**

Dedicated left-turn lanes are warranted at the various access intersection into the site as outlined in **Section 6.2**. Traffic volumes generally exceed the left-turn warrant bounds.

The recommended dedicated turn lane storage lengths are determined based on the forecasted 95th percentile queue lengths.

6.3.1 Appleby Line at Dundas Street

Under the future Total horizons, critical movements are projected in the westbound left-turn, northbound left-turn, northbound through, and southbound through-lanes throughout the weekday and Saturday peak hours, operating at LOS E-F and queues exceeding storage at the left-turn lanes.

To accommodate projected traffic volumes, the existing traffic control signal cycle times were optimized. This improvement is triggered by the 2035 Background volumes.

[19] City of Burlington, *Integrated Mobility Plan*, September 2023
[20] Halton Region, Appendix E - Transportation Master Plan to 2031, October 2011
[21] Ontario Traffic Manual (OTM) Book 12 – Traffic Signals, July 2011.

The signal warrant analysis indicates traffic control signals are not warranted under the 2045 horizon. Even though the signal criteria have not been met, installing unwarranted traffic control signals would improve operations for vehicles and support pedestrians and cyclists.

Despite applying these mitigation measures, several movements are still projected to exceed capacity with a v/c ratio exceeding 1.00 and operate with LOS F, primarily due to high traffic volumes along Appleby Line and Dundas Street as shown in **Table 6.5** and **Table 6.6**.

6.3.2 Appleby Line at Upper Middle Road

Critical movements are forecast in the eastbound left, eastbound through-right, westbound left, westbound right, westbound through, northbound left, northbound through-right, southbound left, and southbound through-right lanes under the Total horizons during the weekday and Saturday Peak hours. Operations are expected to be in the LOS B-F range with v/c ratios exceeding 0.85 and queues exceeding storage at the left-turn lanes.

To accommodate existing and projected traffic volumes, double westbound left and southbound left-turn lanes are added along with protected westbound and southbound left-turn phases and signal timing optimizations. A high-level functional drawing of the intersection can be found in **Appendix O**.

With the implementation of these mitigation measures, delays are expected to be reduced by up to 91 seconds on the eastbound approach, 66 seconds on the westbound approach, and up to 286 seconds for the southbound left-turn lane during the weekday and Saturday peak hours. Despite these reductions, several of the movements are still projected to exceed capacity with a v/c ratio exceeding 1.00, as well as queues exceeding the available storage at exclusive turn lanes primarily due to high traffic volumes along Appleby Line and Upper Middle Road.

6.3.3 Upper Middle Road at West School Driveway/Private Driveway

During the weekday AM peak hour, the eastbound through-right and northbound through-left lanes are projected to operate at LOS C and E respectively with v/c ratios of 0.85 under the future Total horizons.

To accommodate projected traffic volumes, the existing traffic signal cycle times were optimized. This improvement is triggered by the 2045 Background volumes.

With these mitigation measures, under the 2045 future Total horizon, the northbound through-left lane can see a reduction in delays by 51

seconds, with a v/c ratio less than 0.70 during the weekday AM peak. However, the eastbound through-right lane is still projected to be a critical movement as the v/c ratio exceeds 0.85, primarily due to high traffic volumes along Upper Middle Road.

6.3.4 Upper Middle Road at Quinte Street

Critical movements are anticipated in the northbound and southbound approaches with delays operating at LOS D-F during the weekday and Saturday peak hours under the future Total horizons.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected 2035 Total traffic volumes. Some possible upgrades include implementing the following:

- Signalize the intersection (OTM Warrants Not Satisfied – Signalization recommended based on operational considerations);
- Separate eastbound left-turn lane; and
- Separate left-turn lanes for the northbound and southbound approaches with protected-permissive left-turn phases.

With these mitigation measures, a significant reduction in delays in the northbound and southbound movements are noted during the weekday and Saturday peak hours, improving to LOS C or better, with v/c ratios less than 0.30. Critical movement is note in the westbound approach with delays in the LOS D-E range during the weekday and Saturday peak hours with a v/c ratio over 0.95 due to high traffic volumes along Upper Middle Road.

6.3.5 Upper Middle Road at Sutton Drive

Critical movements are projected in the eastbound left, westbound approach, and southbound approach during the weekday and Saturday peak hours under the future Total horizons. Operations are forecast to be in the LOS D-F range with v/c ratios over 0.85 and queues exceeding storage for the left-turn lanes

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected 2035 Total traffic volumes. Some possible upgrades include implementing the following:

- Double southbound left-turn lanes;
- Northbound left-turn lane and protected-permissive phase;
- Westbound left-turn lane and protected-permissive phase; and

- Optimizing the timing of traffic signals.

A high-level functional drawing of the intersection can be found in **Appendix O**. Implementing these mitigation measures are projected to improve the operations of the eastbound, westbound, and northbound movements during the weekday and Saturday peak hours, with a reduction of delays by up to 93 seconds in the eastbound left and 444 seconds in the southbound approach.

Despite this, the eastbound and southbound left-turn lanes are expected to continue to experience queues greater than the available storage. The westbound through-right lane is still expected to operate with a v/c ratio exceeding 0.85 during the weekday PM peak hour, due to high traffic volumes along Upper Middle Road.

6.3.6 Upper Middle Road at Blue Spruce Avenue

Under the future Total horizons, critical movements are projected in the eastbound left-turn and southbound approach, operating at LOS D-F during the weekday and Saturday peak hours.

To accommodate existing and projected traffic volumes, traffic signals can be implemented to the existing stop-controlled intersection.

The signal warrant analysis indicates traffic control signals are not warranted under the 2045 horizon. Even though the signal criteria have not been met, installing unwarranted traffic control signals would improve operations for vehicles and support pedestrians and cyclists. The spacing between the upstream and downstream traffic control signals is 400 m or more.

These adjustments are forecast to improve the operation of the southbound movement during the weekday and Saturday peak hours, operating at LOS B or better with Delays are projected to be less than 20 seconds. Significant improvements are primarily noted in the southbound approach, with delays reduced by 306 seconds during the weekday peak hours. The westbound through-right lane during the weekday PM peak hour is noted to experience a v/c ratio over 0.90, however, it is still expected to operate in the LOS B range with delays less than 15 seconds. In addition to delay reduction, signalization of this intersection provides an opportunity for a controlled crossing for pedestrians and cyclists.

Overall, signalization is recommended to reduce delays for the southbound approach and support active transportation in the study area.

6.3.7 Burloak Drive at Bronte Creek Provincial Park Access

Critical movements are projected in the westbound approach and southbound left-turn lane during the weekday and Saturday peak hours under the future Total horizons, operating in the LOS D-F range. Delays on the westbound approach during the weekday PM peak hour with forecast to be greater than 700 seconds with a v/c ratio over 1.00.

To accommodate existing and projected traffic volumes, traffic signals can be implemented to the existing stop-controlled intersection. The signal warrant analysis indicates traffic control signals are not warranted under the 2045 horizon. The spacing between the upstream and downstream traffic control signals is 400 m or more.

These adjustments are forecast to improve the operation of this intersection, with all movements operating at LOS C or better, with delays less than 30 seconds during the weekday and Saturday peak hours. The westbound approach during the weekday PM peak hour will see the largest reduction in delays, with delays at 28 seconds and v/c ratio of less than 0.45.

A traffic signal is also expected to improve pedestrian and cycling safety by providing a control crossing of Burloak Drive.

6.3.8 Burloak Drive at Mainway

Under the future Total horizons, critical movements are forecast in the eastbound right-turn and northbound left-turn lanes during the weekday peak hours, operating at LOS F with a v/c ratio over 1.00 and left-turn queues exceeding storage.

Adjustments to the roadway geometry are necessary to increase roadway capacity to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Optimize signal cycle times of the existing traffic signals; and
- Double northbound-left turn lanes with protected phase.

This improvement is triggered by the 2035 Background volumes. A high-level functional drawing of the intersection can be found in **Appendix O**. Implementation of traffic signal adjustments and implementing double northbound left-turn lanes is forecast to improve operations of the eastbound and northbound approaches during the weekday and Saturday peak hours, reducing delays by up to 825 seconds for the northbound left-turn lane. The eastbound right-turn lane is also expected to see a reduction in delays by up to 204 seconds. Despite this, the northbound left-turn lane will still exceed the

available storage by approximately 40 m due to the high traffic volumes along Burloak Drive and Mainway.

It is noted that double northbound left-turn lanes may not be feasible as the intersection may already be at the ultimate cross-section width with the widening of Burloak Drive. In addition, adding lanes may not be desirable as increasing roadway width can have negative impacts to pedestrian and cycling environments.

Alternative measures have been tested including increasing queue storage and signal timing phasing. Increasing queue storage lane alone is not expected to improve operations as it does not equate to additional capacity at the intersection. Alternative signal phasing had limited impact due to high traffic volumes on multiple approaches.

To avoid such area intense mitigation measures, the reduction of future growth and single occupant vehicles is required. An increased modal split will need to be considered to decrease the number of single person vehicle trips, which the site will also support through Transportation Demand Management (TDM) measures to improve active transportation and accessibility.

6.3.9 Mainway at Sutton Drive

Critical movements are forecast in the northbound and southbound approach during the weekday peak hours under the future Total horizons, operating at LOS F. Delays are expected to exceed 700 seconds with v/c ratios 0.90.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected 2035 Total traffic volumes. Some possible upgrades include implementing the following:

- Signalizing the intersection (OTM Warrants Satisfied); and
- Eastbound left-turn lane with a protected-permissive phase.

Reconfiguring the lane layout and signalizing the intersection is projected to improve the operations of the intersection. During the weekday and Saturday peak hours, all movements are expected to operate with LOS B or better with v/c ratios less than 0.85, with the exception being the southbound approach during the weekday PM peak hour operating at LOS D with a v/c ratio over 0.85. However, this mitigation measure is still expected to provide a substantial improvement, as the southbound approach improves from excessive delays and a v/c ratio exceeding 3.00 to below capacity.

6.3.10 Mainway at Norjohn Court/Lampman Avenue

Critical movements are forecast in the northbound and southbound approach during the weekday peak hours under the future Total horizons, operating at LOS E-F.

To accommodate existing and projected traffic volumes, traffic signals can be implemented to the existing stop-controlled intersection. Note that additional turn lanes with unsignalized intersection were tested but were not found to reduce the delays. As the delays stem from the high volume of eastbound/westbound traffic, northbound and southbound movements require controlled gaps to complete manoeuvres.

The signal warrant analysis indicates traffic control signals are not warranted under the 2045 horizon. Even though the signal criteria have not been met, installing unwarranted traffic control signals would improve operations for vehicles and support pedestrians and cyclists. The spacing between the upstream and downstream traffic control signals is 415 m or more.

Adjusting the signal timings is anticipated to improve operations for all movements, primarily in the northbound and southbound approaches by reducing delays by up to 449 seconds during the weekday peak hours.

6.3.11 Appleby Line at Mainway

Under the future Total conditions, critical movement is expected in the eastbound left, eastbound through-right, westbound left, westbound through-right, northbound left, northbound through-right, southbound left, and southbound through-right lanes, operating at LOS B-F with v/c ratios greater than 0.85 and left-turn queues exceeding the available storage.

To accommodate existing and projected traffic volumes, the existing traffic signal cycle times were optimized.

Optimized signal timings are anticipated to improve operations for all movements by reducing delays by up to 72 seconds in the eastbound left-turn lane, 81 seconds in the westbound left-turn lane, 188 seconds in the northbound left-turn lane, and 36 seconds in the southbound left-turn lane during the weekday peak hours. Although, critical movements are still expected in the eastbound left, westbound through-right, northbound left, northbound through-right, and southbound through-right movements due to high traffic volumes along Appleby Line, the proposed measures are anticipated to reduce delays primarily in the weekday PM peak hour.

Additional measures have been tested, including increasing queue storage. It is noted that increasing queue storage lane alone is not expected to improve operations as it does not equate to additional capacity at the intersection and does not change the forecast delay.

Increasing road capacity by adding travel lanes may not be feasible as the intersection may already be at the ultimate cross-section width with the widening of Appleby Line. In addition, adding lanes may not be desirable as increasing roadway width can have negative impacts to pedestrian and cycling environments.

6.3.12 Appleby Line at Corporate Drive

Under the future Total conditions, critical movement is expected in the westbound approach and northbound through-right lanes, operating at LOS B-F with v/c ratios greater than 0.85 during the weekday and Saturday peak hours.

To accommodate projected 2035 Total traffic volumes, the existing traffic signal cycle times were optimized.

Optimizing signal timings are anticipated to improve operations for all movements, primarily in the westbound approach by reducing delays by up to 40 seconds. Despite these reductions, critical movements are still noted in the westbound and northbound through-right movements during the weekday PM peak hour due to high traffic volumes along Appleby Line.

6.3.13 Burloak Drive at North Service Road

Critical movements are expected in the eastbound right, northbound left, and northbound through lanes under the future Total horizons during the weekday peak hours. Operations are primarily in the LOS F range, with the exception of the northbound through lane, operating at LOS B with v/c ratios greater than 0.85 during the weekday PM peak hour under the Total 2045 horizon.

To accommodate projected 2035 Background traffic volumes, double northbound left-turn lanes can be implemented along Burloak Drive. A high-level functional drawing of the intersection can be found in **Appendix O**.

Adjusting the lane configuration and signal timings are anticipated to improve operations for the northbound left-turn lane during the weekday AM peak hour by reducing delays by up to 164 seconds. During the weekday PM peak hour, delays in the eastbound right-turn lane are expected to improve by up to 153 seconds. However, critical

movements are still projected at the intersection due to high traffic volumes along Burloak Drive.

6.3.14 Burloak Drive at QEW Westbound Off-Ramp

Critical movements are expected in the westbound left, westbound right, northbound through, and southbound through lanes during the weekday and Saturday peak hours during the existing, Background, and Total horizons. Operations range from LOS C-F with v/c ratios greater than 0.90 and right-turn queues exceeding the available storage.

Adjustments to the roadway geometry and traffic control are necessary to accommodate existing and projected traffic volumes. Some possible upgrades include implementing the following:

- Separating the existing westbound left-right turn lane to double left and right turn lanes; and
- Optimizing the timing of traffic signals

Implementing these measures are forecast to reduce delays by up to 605 seconds in the westbound approach during the weekday and Saturday peak hours. Despite the delay reductions, capacity issues are still expected. The movements still exceeding capacity includes the westbound approach, northbound, and southbound approaches due to the high traffic volumes along Burloak Drive and QEW off-ramp during the future horizon.

Although westbound queuing is forecast to extend beyond the available storage, queues are not expected to impact QEW mainline highway operations with mitigation measures.

6.3.15 Burloak Drive at QEW Eastbound Off-Ramp/Red Oak Boulevard

Critical movements are projected in the eastbound left and southbound through lanes during the weekday and Saturday peak hours under the Total horizons, operating at LOS E-F with v/c ratios over 0.80.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected 2035 Background traffic volumes. Some possible upgrades include implementing the following:

- Converting the eastbound through lane to a through-left lane; and
- Optimize the timing of traffic signals.

The adjustments to the lane configuration and signal timings are projected to improve operations during the weekday and Saturday peak hours. The southbound approach is expected to operate with delays reduced by up to 37 seconds. Despite these reductions, critical movements are still anticipated due to high traffic volumes along Burloak Drive.

6.3.16 Appleby Line at North Service Road

Critical movements are projected in the eastbound left, westbound left, westbound through-right, northbound left, and northbound through-right lanes during the weekday PM peak hour, under the Total horizons. Operations range between LOS B-F with v/c ratios exceeding 0.85 and left-turn queues exceeding the available storage.

To accommodate existing and projected traffic volumes, the existing traffic signal cycle times were optimized.

Optimized signal timings are anticipated to improve operations by reducing delays for the eastbound left-turn lane by 34 seconds, 8 seconds for the westbound through-right, and 21 seconds for the northbound left-turn lane during the weekday PM peak hour. However, critical movements are still projected at the intersection with queues exceeding the available storage, due to high traffic volumes along Appleby Line. The movements still exceeding capacity includes the eastbound left, westbound approach, northbound approach, and southbound through-right lanes.

6.3.17 Appleby Line at QEW Westbound Off-Ramp

Critical movements are projected in the westbound left, westbound right, northbound through, and southbound through lanes during the weekday and Saturday peak hours under the future Background and Total conditions. The westbound approach operates at LOS F with v/c ratios over 1.00 and left-turn queues exceeding storage during the weekday PM peak hour. The northbound and southbound approaches operate at LOS A-D with v/c ratios greater than 0.85.

Adjustments to the roadway geometry and traffic control are necessary to accommodate existing projected traffic volumes. Some possible upgrades include implementing the following:

- Double westbound right-turn lanes; and
- Optimize the timing of traffic signals.

Implementing these measures are forecast to reduce delays by up to 158 seconds in the westbound left and 850 seconds in the westbound

right-turn lane during the weekday and Saturday peak hours and by 22 seconds in the northbound approach during the weekday AM peak hour. Despite the significant delay reductions in the westbound approach, capacity issues are still expected. The movements still exceeding capacity includes the westbound left-turn, westbound right-turn, northbound, and southbound approaches due to the high traffic volumes at Appleby Line at QEW Westbound Off-ramp. With the mitigation measures, queuing on the QEW westbound off-ramp is not expected to impact the QEW mainline operations.

6.3.18 Appleby Line at QEW Eastbound Off-Ramp

Under future Total conditions, critical movements are projected for the eastbound left, eastbound right, northbound through, and southbound through lanes during the weekday and Saturday peak hours. The eastbound approach operates at LOS C-E with v/c ratios over 0.60 and right-turn queues exceeding storage. The northbound and southbound approaches operate at LOS C with v/c ratios greater than 0.95 during the weekday AM peak, and at LOS F with a v/c ratio over 1.00 during the weekday PM peak hour.

To accommodate existing and projected traffic volumes, the existing traffic signal cycle times were optimized.

Implementing these measures are forecast to reduce delays by up to 18 seconds in the eastbound approach during the weekday and Saturday peak hours. During the PM peak hour, delays are reduced by up to 44 seconds in the southbound approach. However, these movements are still projected to operate as critical movements due to high traffic volumes at the intersection.

Although queuing is forecast to extend beyond the available storage, queues are not expected to impact QEW mainline highway operations.

6.3.19 Appleby Line at Harvester Road

Critical movements are projected in the eastbound left, eastbound through-right, westbound left, westbound through-right, northbound through, southbound left, and southbound through lanes during the weekday and Saturday peak hours under the Total horizons. Operations range from LOS C-F with v/c ratios greater than 0.85 and left-turn queues exceeding the available storage.

Adjustments to the roadway geometry and traffic control are necessary to accommodate existing and projected traffic volumes. Some possible upgrades include implementing the following:

- Double southbound left-turn lanes with a protected phase; and

- Optimize the timing of traffic signals.

A high-level functional drawing of the intersection can be found in **Appendix O**. Implementing these measures are forecast to reduce delays by up to 43 seconds in the eastbound approach, and 146 seconds in the westbound approach during the weekday PM peak hour. The southbound left-turn lane can also see a reduced delay of 61 seconds during the weekday AM peak hour. However, the eastbound left, westbound approach, northbound through, northbound right, southbound left and southbound through lanes are still projected to operate as critical movements due to high traffic volumes at the intersection.

6.3.20 Appleby Line at Fairview Street

Critical movements are projected in the eastbound left, eastbound right, northbound left, northbound through, southbound left, southbound through, and southbound right-turn lanes during the weekday and Saturday peak hours under the Total horizons. Operations range from LOS D-F with v/c ratios greater than 0.90 for through lanes, as well as the left and right-turn queues exceeding the available storage.

To accommodate existing and projected traffic volumes, the existing traffic signal cycle times were optimized.

Despite applying these mitigation measures, several movements are still projected to exceed capacity with a v/c ratio exceeding 1.00, as well as queues exceeding the available storage at exclusive turn lanes primarily due to high traffic volumes along Appleby Line and Fairview Street.

6.4 Modal Shift Reduction Modification

Sustainability is a principle that cuts across all developments as it is ingrained in developing a balanced multi-modal transportation system and is supported by the City of Burlington. The City is committed to building and maintaining a community that meets today's needs while providing a high quality of life.

The traffic growth rates on the surrounding road network are forecast to be between 1-4%, compounded annually, as confirmed during pre-consultation comments with the City, Region, and MTO. By the 10-year after build-out horizon, the growth rates result in existing traffic increasing by up to 106% without the proposed development.

This growth assumes the auto-centric travel patterns of today continue into the future and does not account for mode share targets.

The Region and City have identified modal split targets within the Transportation Master Plan[22] and Integrated Mobility Plan[23], respectively.

The Region has identified transit mode share targets to be reached over the next several years, with transit mode share seeking a target of 20% of all trips.

The City of Burlington has outlined a mode-share-driven approach rather than a corridor-capacity approach for addressing future travel demand. The City of Burlington IMP identifies the existing mode share for the study area as 91% auto, 3% transit, 1% bicycle, and 6% walking.

The subject site location is designated as a “Business Park zone”, which the City proposes a 2051 target mode share of 75% auto, 13% transit, 5% bicycle, and 7% walking for an overall 16% mode shift away from auto modes.

However, if the subject site is considered a “Residential” zone like the Orchard subdivision north of Upper Middle Road, the proposed 2051 target mode share is 72% auto, 15% transit, 5% bicycle, and 8% walking for an overall 19% mode shift away from auto modes.

The Appleby GO MTSA, located less than 5 km from the subject site, has proposed mode share targets of 55% auto, 23% transit, 9% bicycle, and 13% walking for an overall 36% mode shift away from

[22] Halton Region, The Road to Change, Halton Regional Transportation Master Plan (2031), September 2011.
[23] City of Burlington, *Integrated Mobility Plan*, September 2023

auto modes[24]. Given the proximity to the Appleby MTSA, the density and mix of the development, and the potential for convenient and frequent transit service between the site and the Appleby MTSA, future transit mode shares have the potential to shift higher than the 13-15% target.

Table 6.8 summarizes the existing and proposed mode share targets.

TABLE 6.8: CITY OF BURLINGTON PROPOSED MODE SHARE TARGETS

Mode Share	Auto	Transit	Bicycle	Walk	Shift from Auto
Existing (Business Park)	91%	3%	1%	6%	-
Proposed Target (Business Park)	75%	13%	5%	7%	-16%
Proposed Target (Residential)	72%	15%	5%	8%	-19%
Proposed Target (MTSA)	55%	23%	9%	13%	-36%

A sensitivity analysis to assess the impact of auto mode share shifts on the intersection operations has been undertaken for the Total 10-year traffic conditions with mitigation measures. A 15% reduction to auto traffic at all intersections has been applied to account for a shift towards transit and active transportation.

Table 6.9 – 6.11 summarizes the results of the sensitivity analysis. **Appendix P** contains the detailed Synchro reports. The shift from auto mode share is forecast to decrease delay at the study area intersections.

The expected growth in traffic (both non-site and site generated) would still require mitigation to address forecast delays.

6.5 Active Transportation and Transit Trips

6.5.1 Active Transportation

The proposed mixed-use development will support pedestrian travel by providing pedestrian connections in and around the subject site, including sidewalks on at least one side of the road for the internal network, excluding laneways.

Pedestrian network connectivity and walkability are expected to improve with the proposed development as more walkable destinations are added to the subject site, such as retail and employment land uses. People in the Phase 1 development can also access the surrounding destinations through the proposed sidewalk connections to the existing municipal sidewalks and controlled crossings at Sutton Drive. To access Bronte Creek Provincial Park, pedestrians from Phase 1 can cross Upper Middle Road at the Sutton Drive signalized intersection and utilize existing sidewalks on the north side of Upper Middle Road. As part of the Phase 1 development, an unwarranted signal is recommended at the Bronte Creek Provincial Park access. The unwarranted signal will provide an additional controlled crossing of Burloak Drive for pedestrians and cyclists.

The recommended signalization Mainway at Sutton Drive will enhance walkability by adding additional pedestrian-controlled crossings along Mainway, which currently have relatively long spacing between controlled crossing points. Signalization will also enhance the cycling network by providing controlled crossing points for cyclists.

The proposed residential, retail, institutional, and employment mix supports the sustainable community vision outlined by the City in the Official Plan and IMP.

The City recognizes that cycling is important in intensification areas with high demand for trips and road capacity for auto demand that cannot be provided, such as Upper Middle Road and Burloak Drive. In the study area, on-street bike lanes are provided along Appleby Line, Upper Middle Road, Burloak Drive, Corporate Drive, and Sutton Drive.

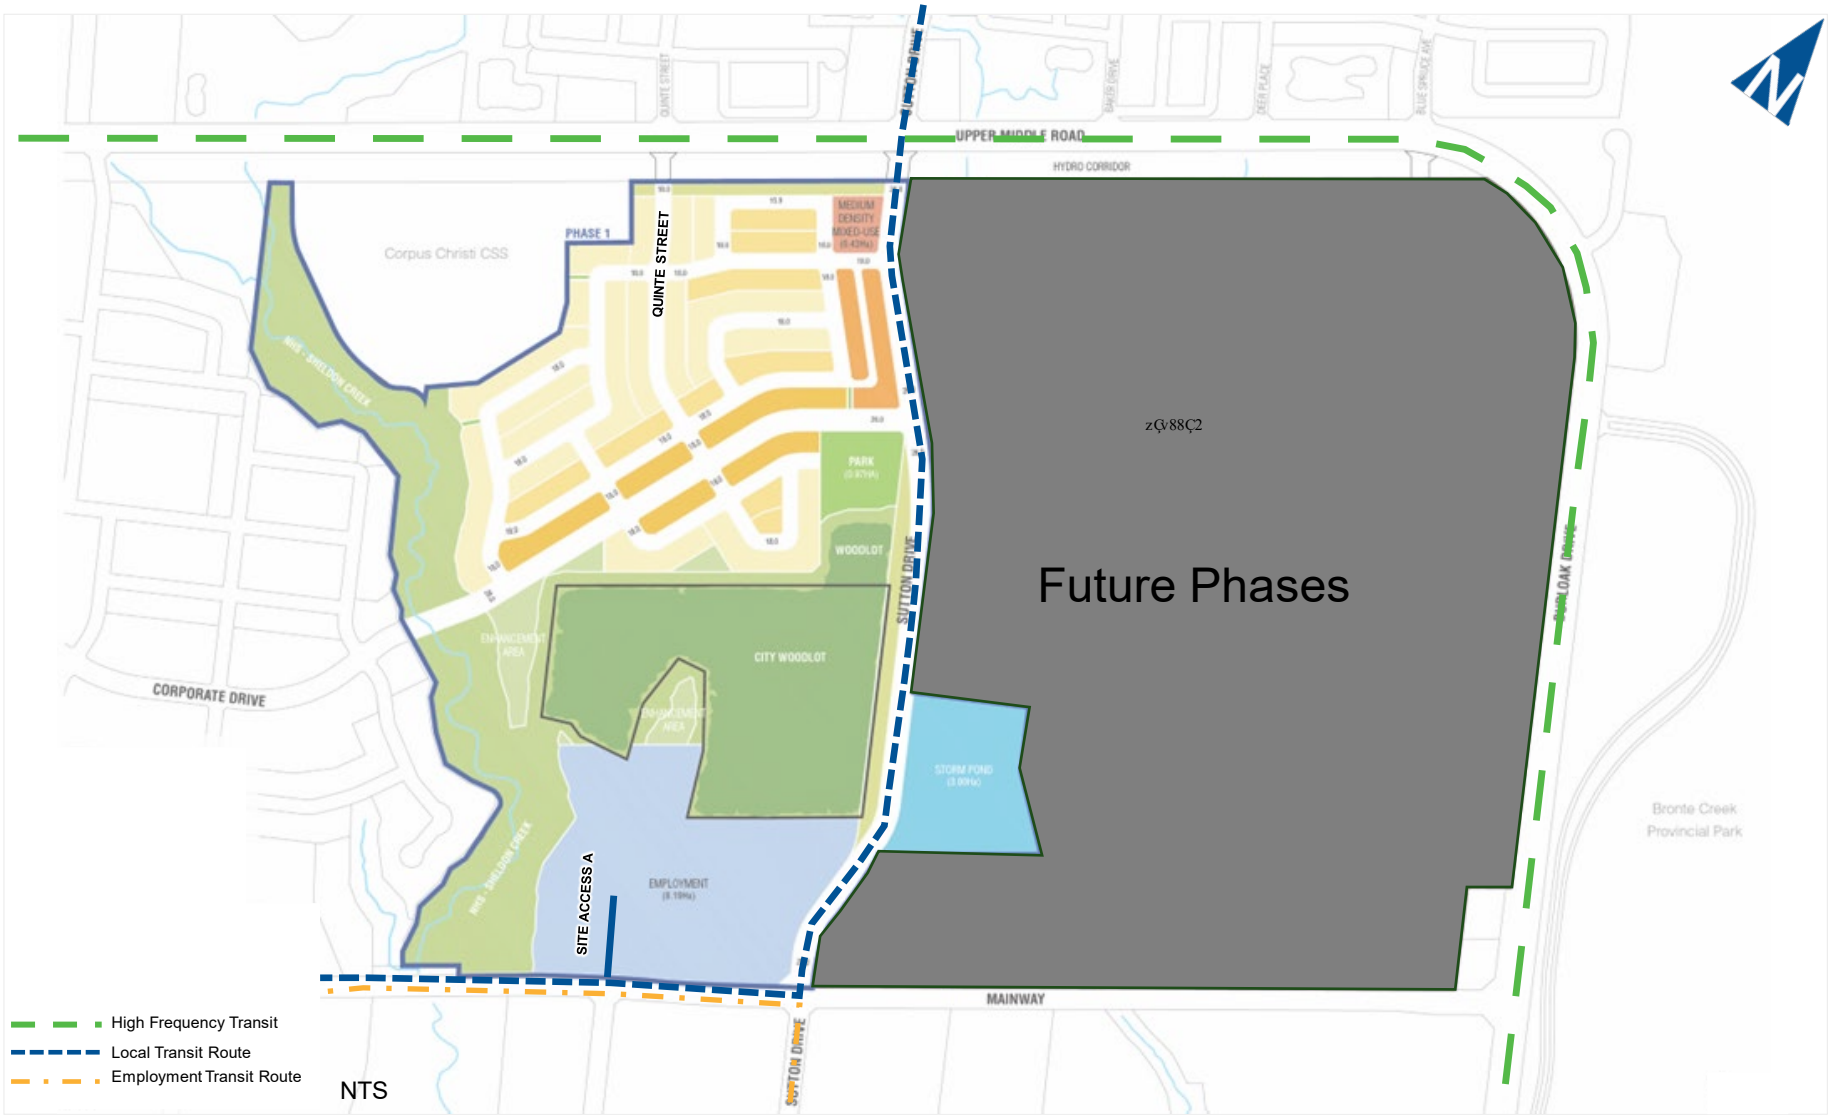
The City of Burlington Cycling Plan[25] indicates future improvements to the city cycling network. These improvements include protected bikeways along Mainway and North Service Road through the study area.

The proposed development supports this cycling infrastructure by including mixed-use land-use, sidewalk connections, and providing the

[25] City of Burlington, *Cycling Plan,* (Burlington: City of Burlington).

additional road right-of-way to accommodate the cycling infrastructure throughout the subject site. Pedestrian facilities will be included on the internal roadways with sidewalks along at least one side of the road for the majority of the streets. Dedicated cycling facilities will be considered along the neighbourhood collector streets such as Sutton Drive and Corporate Drive.

6.5.2 Transit Service



Burlington Transit operates four routes which serve the subject site, primarily on Upper Middle Road and Mainway, east of Sutton Drive.

With the development of the subject site and the future HOV/BRT lanes along Upper Middle Road and Burloak Drive, Burlington Transit is expected to review the transit service coverage and stop locations in the study area that are easily accessible for a potential transit route.

Based on the network and the layout of the subject site, three potential transit routes should be considered to enhance the transit network:

- A high frequency route along Burloak Drive and Upper Middle Road to utilize the planned HOV/BRT lane. The mixed-use density of the development and the placement of the proposed retail land use along Upper Middle Road and Burloak Drive provide attractive and convenient destinations which can support a high frequency route.
- A local route serving the employment and institutional area at the south end of the site along Mainway. Currently, route 81 operates in the area but stop placement and route frequency should be reviewed with the development of the site.
- A local route along Sutton Drive through the subject site. This route would help serve the internal residential land uses and could provide stops at the proposed school and institutional blocks. Route 11 partially serves this area but continues on Upper Middle Road. With the development of the site, this route could be extended through the site or a new local route could be considered.

Figure 6.1 illustrates the potential transit routes. The potential routes would expand on the existing routes to provide transit service to the subject site. Given the proximity to the Appleby GO MTSA, these routes would also provide a convenient and efficient connection to regional transit services, supporting increased accessibility and encouraging transit-oriented development.

6.6 Corporate Drive Connection

The site concept plan shows a potential connection of Corporate Drive through the site to the west over Sheldon Creek. The feasibility and timing of this Corporate Drive connection has yet to be determined but the City has requested that the analysis assume the connection will be in place.

A qualitative assessment has been conducted to assess the impacts the Corporate Drive connection could have on the site generated traffic and the traffic operations if it is not constructed with Phase 1 of the development.

The existing Corporate Drive, east of Appleby Line, is a two-lane neighbourhood connector with an assumed regulatory 50 km/h. Along with layby parking, sidewalks and bike lanes are on either side of the road.

Corporate Drive, east of Appleby Line, primarily serves as a connector road for the surrounding residential subdivision. There are two all-way stop-controlled intersections between Appleby Line and the subject site.

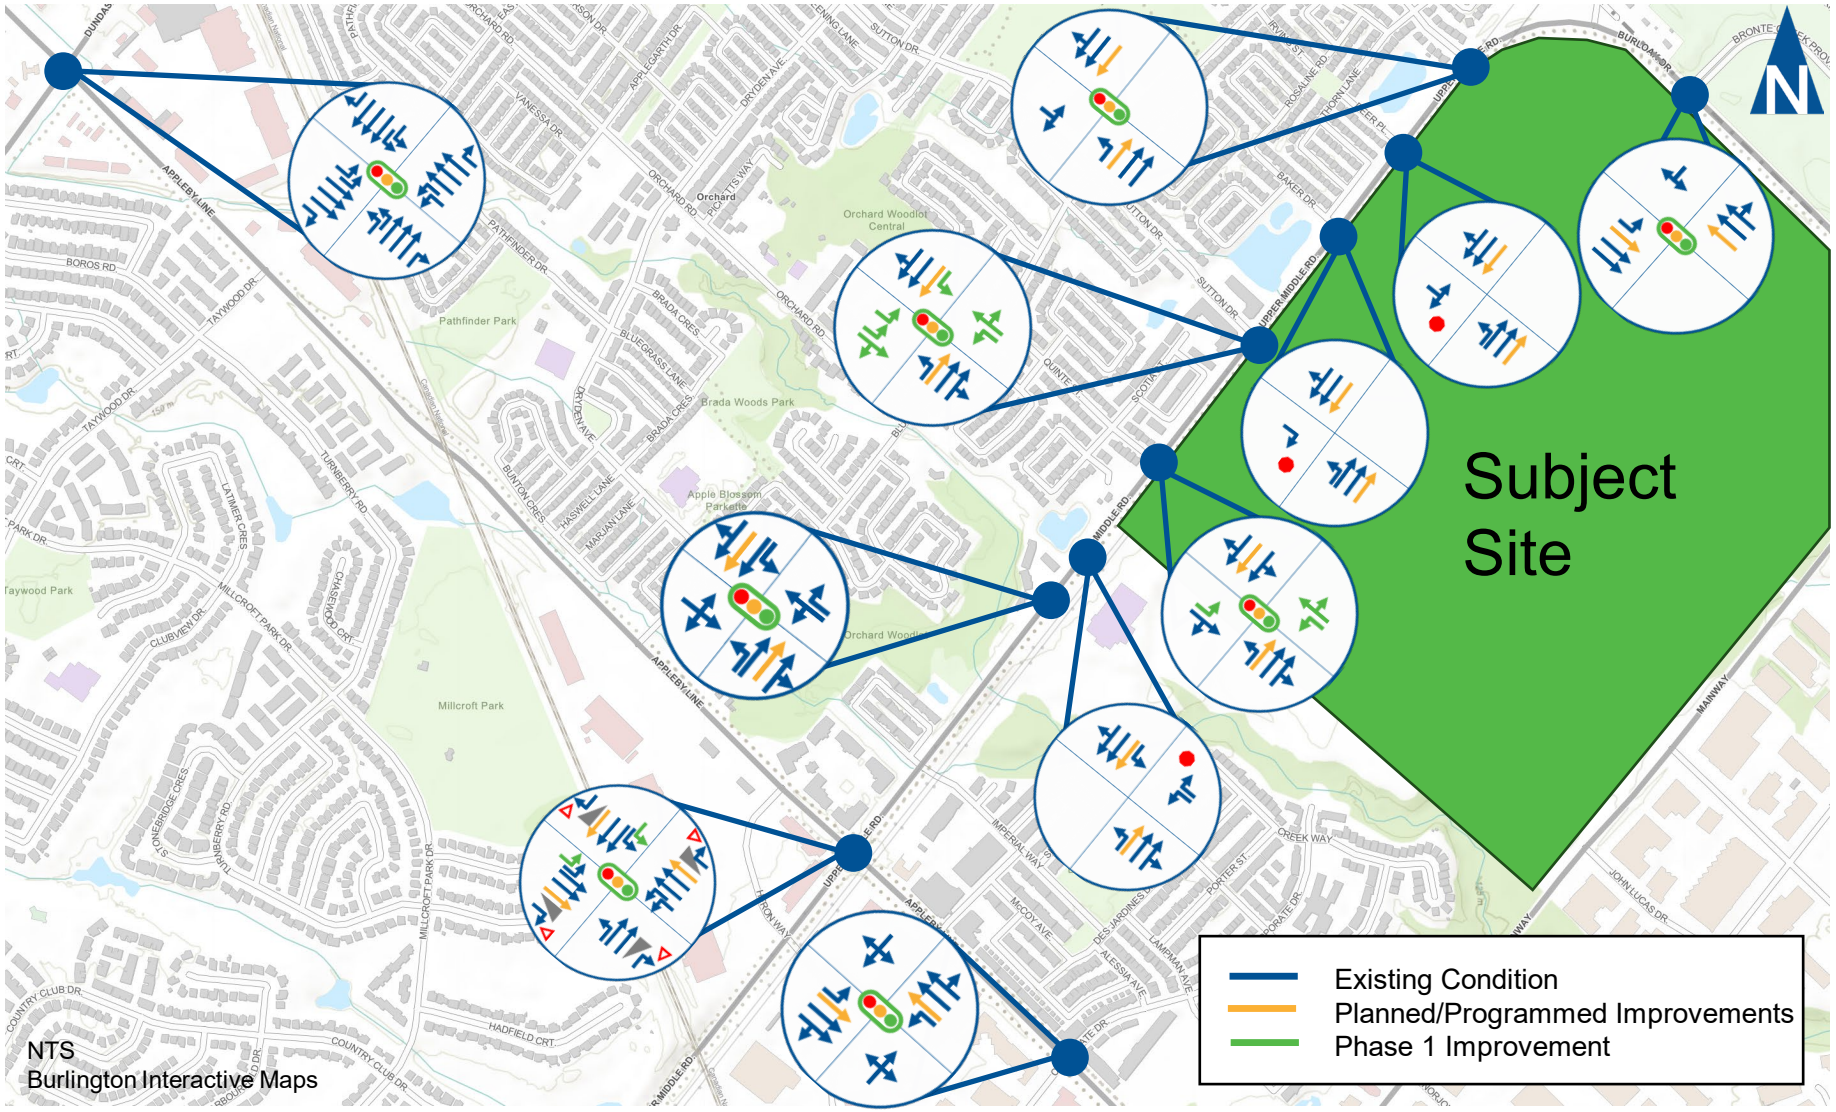
The Phase 1 assignment estimates 100 to 140 two-way peak hour trips to use the Corporate Drive connection. Although the potential Corporate Drive connection will provide a direct route to the subject site, the all-way stop-controlled intersections east of Appleby Line will add delay.

When travelling from the north or south along Appleby Line, routes along Upper Middle Road (an arterial road) or Mainway (a collector road) would provide faster, uninterrupted routes to the subject site.

Within the site, there are approximately 100-150 residential units along Corporate Drive, west of Sutton Road, where travelling across the new connection may be a shorter distance than using Mainway or Upper Middle Road. The Corporate Drive connection may serve as an alternative route to avoid highly congested intersections for a subset of site trips but is not expected to serve a primary route for the large amount of site traffic.

Without the connection, the site traffic using Corporate Drive would divert to Quinte Street or Sutton Drive to access the arterial roads. The operations of the access intersections outlined in **Section 6.3** show that at the access intersections generally have capacity for additional inbound and outbound movements from the site. Diverting the 100-140

peak hour trips to the other access roads is not expected to substantially change operations at those intersections.



Overall, the operations of the Phase 1 development do not require the Corporate Drive connection. Although the connection will help to accommodate some site traffic, the alternative site accesses have capacity to serve the Phase 1 development.

6.7 Improvement Summary

Various improvements are proposed to mitigate future traffic operations at the study area intersections. These improvements address existing conditions, background traffic growth, or site generated traffic.

Figure 6.2 illustrates the proposed future lane configurations and traffic controls.

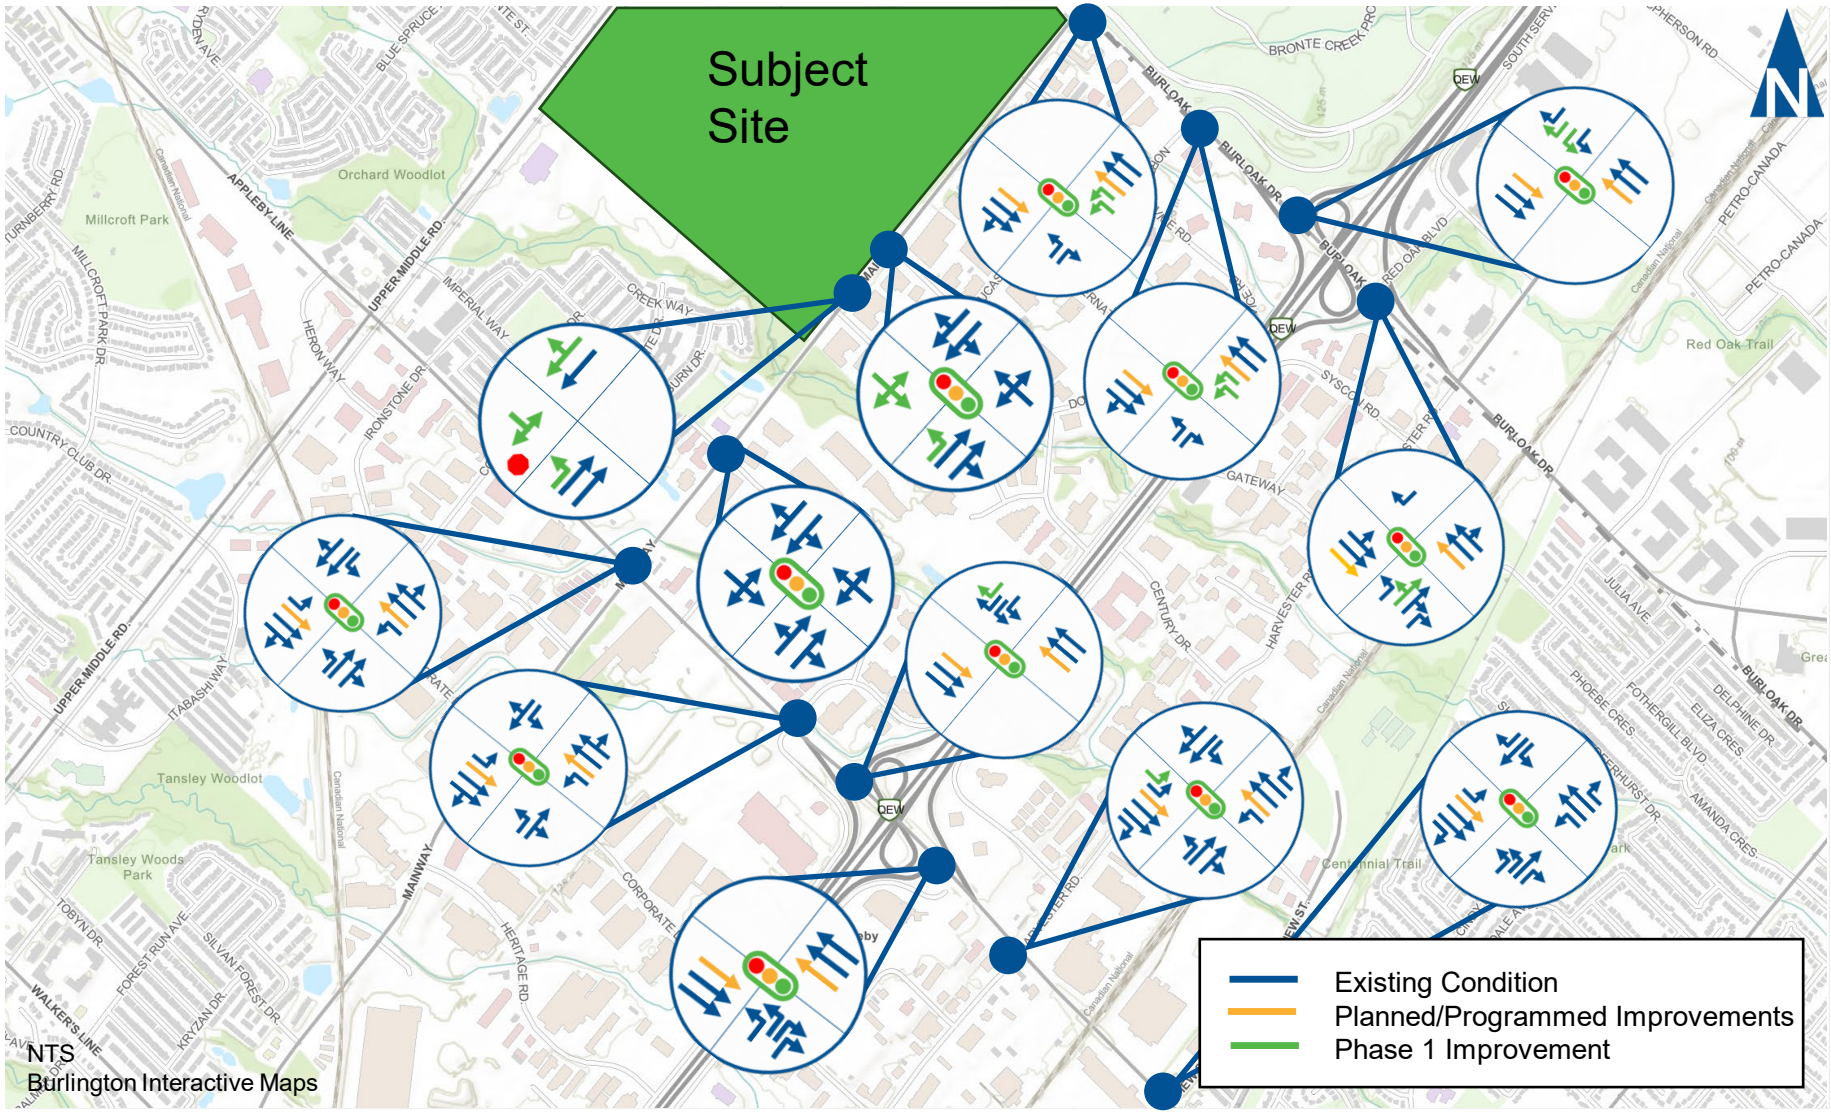


Table 6.12 summarizes the mitigation measures for improvement.

	Double southbound left-turn lane		
Appleby Line & Fairview Street	Signal timing adjustments	Base Year; All Horizons	No

6.8 MTO Highway Improvement Cost Sharing

The analysis determined that a number of improvements are required at the study area intersections including Highway ramp terminals. As outlined in **Section 6.6**, the following Highway ramp lane improvements are recommended:

- Burloak Drive & QEW WB Off-Ramp - Separating the existing left-right turn lane to double left and right turn lanes;
- Burloak Drive & QEW EB Off-Ramp/Red Oak Boulevard - Convert the existing eastbound through-lane to a shared eastbound through-left lane; and
- Appleby Line & QEW WB Off-Ramp - Double westbound right-turn lanes.

Highway improvements are required to accommodate the existing and background growth traffic. As improvements are required regardless of the site development, the Applicant should not be responsible for the full cost of the improvements.

A calculation of the percentage of future traffic associated with the site has been calculated to determine a fair share contribution that can be explored between the Applicant and the road authorities.

Cost-sharing arrangements for specific highway improvements are dependent on the degree that the improvements are warranted by the projected development traffic versus the existing/projected background traffic and timing of the construction.

The fair share is calculated by comparing the relative amount of Phase 1 traffic increase at the critical movements that require improvements for the horizon year when the improvement is triggered.

Table 6.13 summarizes the fair share calculations for the Phase 1 improvements.

At Burloak Drive at QEW Westbound Off-Ramp, separating the existing westbound left-right turn lane to double left and right turn lanes are recommended to address the base year critical movements. As this is a base year condition, the site traffic does not contribute to the traffic triggering the improvement.

At Burloak Drive at QEW Eastbound Off-Ramp/Red Oak Boulevard, converting the eastbound through lane to a through-left lane is recommended to address critical movements triggered in the 2035 Total horizon. A review of the forecasted volumes shows the Phase 1

development traffic accounts for 49% of the peak eastbound right-turn volumes.

At Appleby Line at QEW Westbound Off-Ramp, double westbound right-turn lanes are recommended to address the base year critical movements. As this is a base year condition, the site traffic does not contribute to the traffic triggering the improvement.

TABLE 6.13: FAIR SHARE CONTRIBUTION

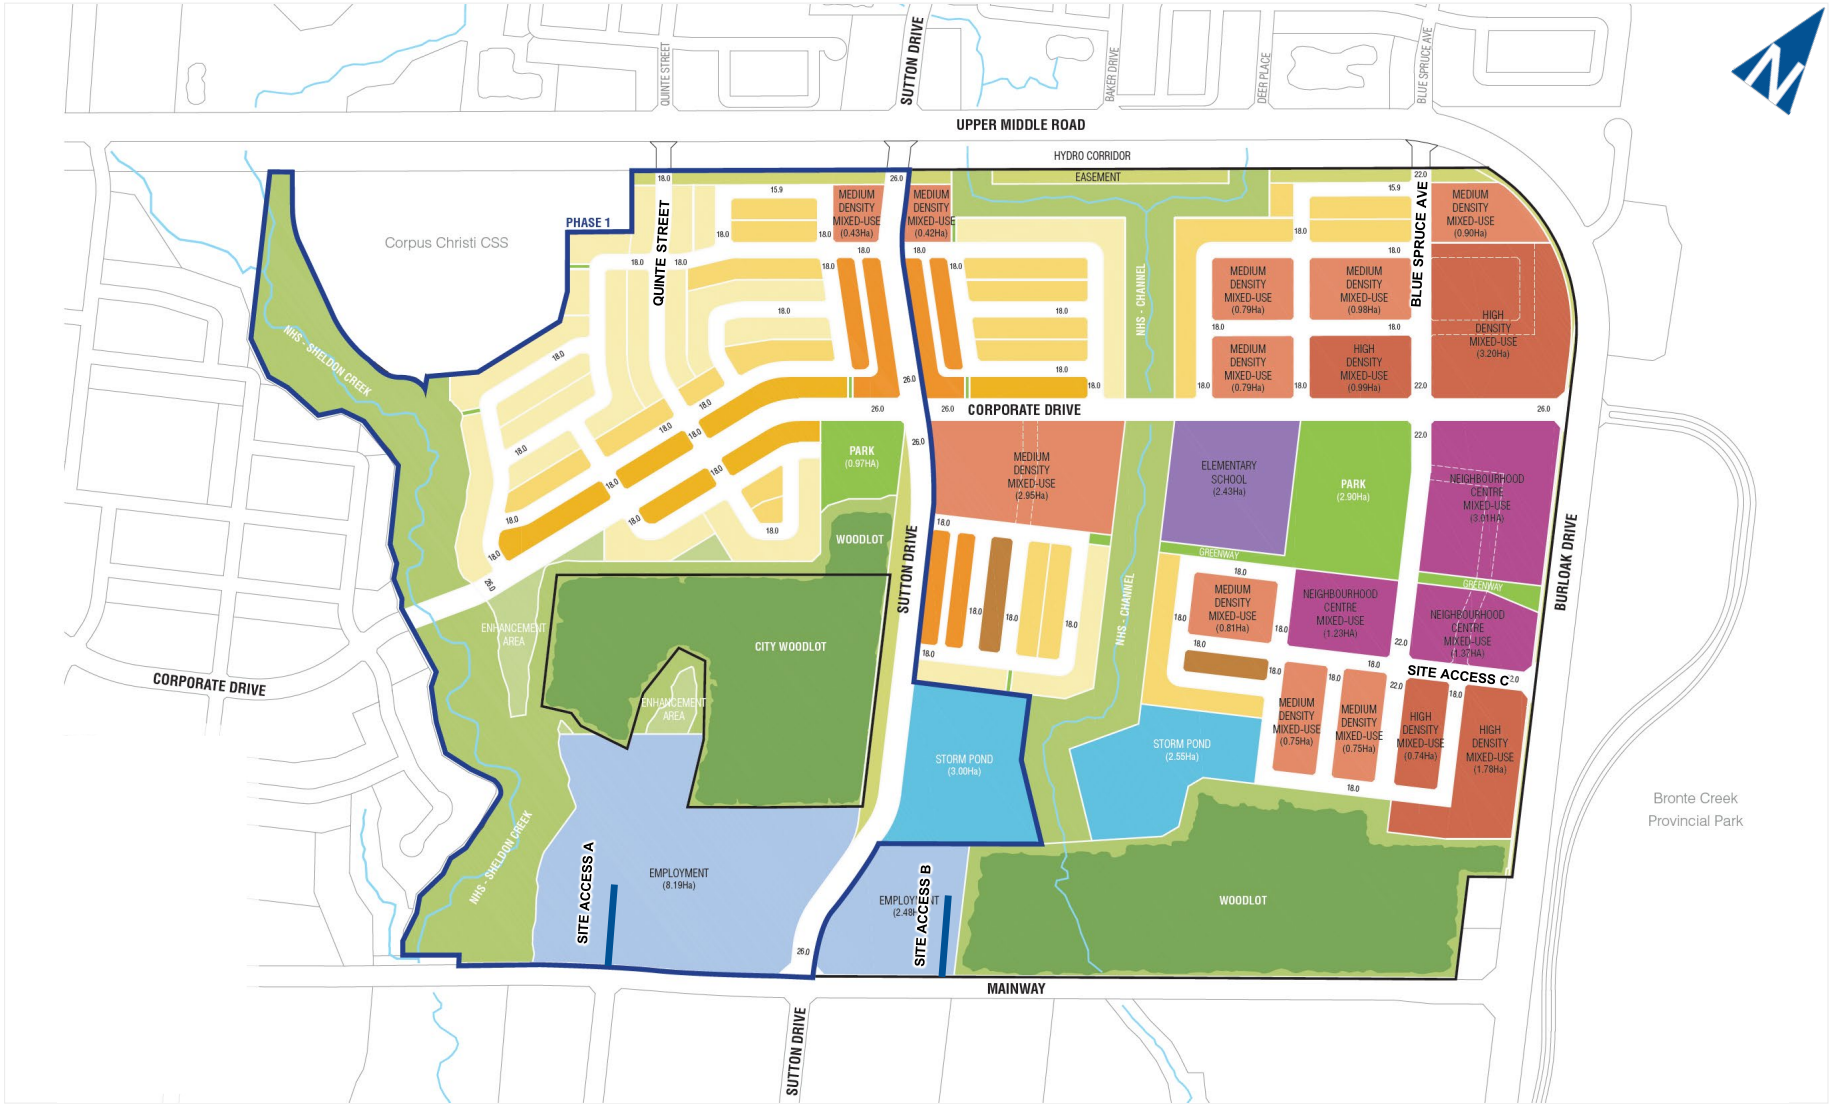
7 Full Build-Out Assessment

The Full Build-Out is anticipated to be completed in a horizon beyond Year 2045 (10 years after Phase 1 Build-Out), at an unknown time.

The concept shows Phases 2 to 4 located between Sutton Road and Burloak Drive. The development application is for the Phase 1 lands only. However, to provide a high-level long-range assessment of the potential road improvements required to accommodate the possible development, a Full Build-Out scenario has been assessed.

The Full Build-Out stats are based on high-level assumptions of development densities, community needs, and are subject to change.

7.1 Development Description



Beyond the Phase 1 development, the full build-out envisions residential (single detached, townhomes, and apartment units), commercial/retail/office, community space, and an elementary school.

The Full Build-Out plans are highly conceptual and subject to change. For the purpose of this assessment, the total site stats (including Phase 1) are estimated to be:

- Single Detached Housing Units – 250 units
- Multifamily Low-Rise Units – 1,220 units
- Multifamily Medium/High-Rise Units – 7,530 units
- Office Space – 23,225 m^2 (250,000 sq.ft.) GFA
- Community Space – 2,695 m^2 (29,000 sq.ft.) GFA
- Commercial Retail Space – 9,105 m^2 (98,000 sq.ft.) GFA
- Elementary School – 600 students

Figure 7.1 illustrates the conceptual Full Build-Out of the subject site.

Vehicle access to Phases 2 to 4 are proposed via a street connection across Blue Spruce Avenue at Upper Middle Road; the Corporate Drive extension to Bronte Creek Provincial Park entrance at Burloak Drive; and a new street connection to Burloak Drive approximately 335 m south of the Corporate Drive extension.

Figure 7.1

7.2 Trip Generation

The trip generation for the Full Build-Out follows the same methodology as Phase 1, outlined in **Section 3.2**. The following additional LUCs were referenced:

- LUC 222 (Multifamily Housing – High Rise);
- LUC 495 (Recreational Community Center);
- LUC 520 (Elementary School);
- LUC 710 (General Office Building);
- LUC 750 (Office Park); and
- LUC 821 (Shopping Plaza).

The estimates of pass-by trips were derived using the Trip Generation Handbook published by ITE[26]. Pass-by trips are a subset of a trip generation that only applies to commercial/retail developments. These trips are made by vehicles already present on the roadway, which businesses attract them into their site as they pass by. The ITE Trip Generation Handbook provides the following pass-by trip rates:

- LUC 821 Shopping Plaza: 40% pass-by trip rate during the weekday PM peak hour and 31% during the Saturday peak hour. No information is available for a pass-by rate during the AM peak hour.

Pass-by trips have only been applied to LUC 821 Shopping Plaza land use located near the arterial roads. This assumption represents vehicles on arterial roads visiting the highly visible retail stores requiring only a short deviation from their current route. Retail land use located within the site, not visible from the arterial roads, are not assumed to have pass-by trips.

Table 7.1 summarizes the forecast full build-out site-generated trips (inclusive of Phase 1), with internal and pass-by credits applied. The site's full build-out trip generation is estimated to be approximately 4,103 new vehicle trips during the weekday AM peak hour, 4,170 new vehicle trips during the weekday PM peak hour, and 3,571 new vehicle trips during the Saturday peak hour.

Figure 7.2 illustrates the site concept plan with each development block into a Traffic Analysis Zone (TAZ). **Table 7.2** summarizes the forecast site-generated trips generated by the TAZ into the total volumes per each land use code. **Figure 7.3** illustrates the site location

[26] Institute of Transportation Engineers. Trip Generation Handbook, 3rd Edition. Washington D.C. 2004.

and additional study area intersections introduced with the full build-out.

Trips are distributed to the network following the same methodology outlined in **Section 3.2.5**.

Figures 7.4 - 7.6 illustrate the net Full Build-Out site-generated traffic estimates for the external and internal road networks.

Figures 7.7 – 7.9 illustrate the Total traffic estimates with Full Build-Out for the external and internal road networks.

7.3 Intersection Assessment

For the purpose of this study, Full Build-Out site traffic is assigned to the Year 2045 horizon with the Phase 1 mitigation measures in place (outlined in **Section 6.6**). Mode shift reductions (forecast to be 15%), as outlined in **Section 6.3**, have not been applied.

Tables 7.3 – 7.6 summarize the capacity analyses for the study area intersections for the 2045 horizon. The capacity analysis results are included in **Appendix Q**.

The following sub-sections outline the operations of the study area intersections with focus on critical movements resulting from the Phase 2-4 site traffic not previously identified in the Phase 1 results.

Under the 2045 horizon year, many study area intersections are forecast to operate at or near their functional capacity. Since the Full Build-Out site traffic assignment adheres to the same methodology utilized in Phase 1, the majority of impacted movements have already been identified, with appropriate mitigation measures previously proposed to address these constraints.

Overall, the study area intersections are forecast to operate at similar levels to the Phase 1 2045 Total Scenario; the exceptions being the new site access intersections for the future phases.

7.3.1 Upper Middle Road at Blue Spruce Avenue

Horizon Year	Operations
2045 Total (Full Build-Out)	Approaching Capacity

Under Full Build-Out of the site, Blue Spruce Avenue is proposed to extend south of Upper Middle Road to provide access to the development. With Phase 1 mitigation measures, the intersection has been assumed to be signalized by Full Build-Out. With site-generated traffic volumes, the westbound approach is forecast to operate at LOS C and v/c ratios exceeding 0.95 during the weekday PM peak hour.

As one of the primary accesses to the subject site, an increase in delay is expected. Improvements to the intersection will be required to accommodate the increase in vehicle traffic.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Westbound movement (v/c > 0.85) (Full Build-Out)

7.3.2 Burloak Drive at Corporate Drive/ Bronte Creek Park Access

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

With Full Build-Out of the site, Corporate Drive will be connected to the eastbound approach of the intersection. With Phase 1 mitigation measures, the intersection has been assumed to be signalized by Full Build-Out.

The addition of site-generated traffic degrades the northbound approach to operate with delays in the LOS A-E range and a v/c ratio greater than 0.90 during the peak hours.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Northbound movement (v/c > 0.85) (Full Build-Out)

7.3.3 Burloak Drive at Site Access C

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

With Full Build-Out of the site, a future full-moves connection at Burloak Drive at Site Access C is planned to provide additional access to the development, located south of the Burloak Drive at Bronte Creek Park/Corporate Drive intersection. Under the assumed two-way stop-control, the eastbound approach is forecast to operate with delays in the LOS F range during the peak hours.

Critical Movements (LOS D or worse)

- Eastbound movement (LOS > D) (Full Build-Out).

7.3.4 Mainway at Sutton Drive

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

The Full Build-Out scenario is forecast to operate similarly to the Phase 1 2045 horizon. Even with Phase 1 mitigation measures, several movements are still projected to experience critical movements including the eastbound left, westbound through-left, northbound approach, and southbound approach.

Critical Movements (v/c over 0.85, v/c over 0.95 for exclusive turn lanes, 95th Percentile queues over storage)

- Eastbound left (v/c > 0.95; 95th queue) (Full Build-Out);
- Westbound through-right (v/c > 0.85) (Full Build-Out);
- Northbound movement (v/c > 0.85) (Full Build-Out); and
- Southbound movement (v/c > 0.85) (Full Build-Out).

7.3.5 Mainway at Site Access B

Horizon Year	Operations
2045 Total (Full Build-Out)	Within Capacity

A new site connection at Mainway and Site Access B is provided to accommodate for additional site generated traffic for the Office Park development located along Mainway, east of Sutton Drive. Under the assumed two-way stop-control, all movements are forecast to operate at LOS C or better.

7.3.6 Sutton Drive at Corporate Drive

Horizon Year	Operations
2045 Total (Full Build-Out) All-Way Stop	Exceeding Capacity
2045 Total (Full Build-Out) Signalized	Within Capacity

As future development phases proceeds, Corporate Drive is planned to extend across the development lands to provide for a new access at the existing intersection of Burloak Drive at Bronte Creek Park Access. With this extension, the primary internal intersection of Sutton Drive at Corporate Drive will transition from a T-intersection to a four-leg cross intersection.

With the proposed all-way stop control at the intersection of Sutton Drive at Corporate Drive, the northbound approach is expected to operate with critical delays of LOS F with v/c ratios greater than 1.00 during the weekday and Saturday peak hours. The westbound and southbound approaches are also expected to operate with critical delays at LOS F and E respectively with v/c ratios over 0.85 during the weekday AM peak hour.

A secondary analysis was conducted using traffic control signals at the intersection to mitigate the projected delays. The signal warrant analysis is provided in **Appendix K**

Although signal warrants indicate that signalization is not required at the intersection, implementing them is projected to show a significant improvement in reducing delays. During the weekday PM and Saturday peak hours, all movements operate at LOS B or better with v/c ratios less than 0.75. The westbound approach during the weekday AM peak hour will still operate as critical with a v/c ratio over 0.85, however delays are expected to be reduced by 126 seconds and operate at LOS C.

Signalizing the internal intersection will also support active transportation through and within the subject site.

Critical Movements (LOS D or worse)

- Eastbound movement (LOS > D) (Full Build-Out).

TABLE 7.3: FULL BUILD ANALYSIS – AM PEAK HOUR (1/2)

7.4 Full Build-Out Left Turn Lanes

The unsignalized intersections within the study area were reassessed to determine whether the additional site-generated traffic associated with the full build-out would warrant the installation of a left-turn lane on the major roadway in accordance with MTO Geometric Design Standards. The same assumptions indicated in **Section 6.2** were applied for this reassessment. **Table 7.7** summarizes the results of the left-turn lane warrant analyses. **Appendix M** contains the nomographs used for each intersection. The following turn lanes are warranted:

- Blue Spruce Avenue at Upper Middle Road – Westbound left-turn lane with 15 m of storage;
- Corporate Drive/Park Access at Burloak Drive – Northbound left-turn lane with over 120 m of storage;
- Site Access C at Burloak Drive – Northbound left-turn lane with over 120 m of storage;
- Sutton Drive at Mainway - Eastbound left-turn lane with over 130 m of storage;
- Site Access A at Mainway - Eastbound left-turn lane with 25 m of storage; and
- Site Access B at Mainway - Eastbound left-turn lane with 15 m of storage.

7.5 Mitigation Measures

Overall, the study area intersections are forecast to operate at levels consistent with the Phase 1 2045 Total Scenario. The Full Build-Out traffic is expected to impact the network similar to Phase 1, where previously identified critical movements in the background scenarios will see further increases in delay. As outlined in **Section 6.6**, proposed intersection improvements generally include the addition of exclusive turn lanes, signalization, or signal timing adjustments.

Many study area intersections experiencing critical movements are expected to reach their ultimate cross-sections by Year 2045. At these locations, further lane expansion is either not physically feasible or would negatively impact the pedestrian and cycling environments.

For signalized intersections where widening is not an option, mitigation is generally limited to signal timing optimization or Transportation Demand Management (TDM) strategies, such as transit enhancements, HOV lanes, and policy shifts, designed to reduce or slow the growth of single-occupant vehicle trips.

Building upon the mitigation measures identified for Phase 1, the intersections outlined in the following sections require additional measures to accommodate the Full Build-Out traffic volumes.

Tables 7.8 – 7.10 summarize the capacity analyses for the study area intersections for the 2045 horizon. The capacity analysis results are included in **Appendix R**.

7.5.1 Upper Middle Road at Blue Spruce Avenue

With future phases of the development, Blue Spruce Avenue is proposed to be extended south of Upper Middle Road to provide for an additional access to the site. To accommodate for the additional site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Signalizing the intersection (OTM Warrants satisfied); and
- Left-turn Lane and protected-permissive phase for westbound traffic.

Overall, signalization is recommended to reduce delays for northbound and southbound approaches and support active transportation in the study area.

7.5.2 Burloak Drive at Corporate Drive/ Bronte Creek Park Access

With future phases of the development, Corporate Drive is proposed to be extended east through the development lands, providing a new access to site from the existing Burloak Drive at Bronte Creek Park intersection. To accommodate for the additional site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Signalizing the intersection (OTM warrants satisfied); and
- Implement a left-turn lane and phase for northbound traffic.

In the Phase 1 mitigation measures, signalization was identified as potential improvement although the signal was unwarranted. With the Full Build-Out of the site, the signal is warranted. As one of the primary accesses to the future phases, an increase in delay is expected and a northbound left-turn lane is recommended.

Overall, with the mitigation measures, the intersection is forecast to operate with delays in the LOS D range or better with v/c ratios less than 0.85 during the peak hours.

A traffic signal is also expected to improve pedestrian and cycling safety by providing a control crossing of Burloak Drive.

7.5.3 Burloak Drive at Site Access C

A future connection at Burloak Drive at Site Access C is planned to provide additional access to the development, located south of the Burloak Drive at Bronte Creek Park/Corporate Drive access. To accommodate for the additional site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Signalizing the intersection (OTM warrants not satisfied);
- Northbound left-turn lane as per left-turn warrant;
- Northbound left-turn protected-permissive phase; and
- Separate eastbound left-turn and right-turn lanes.

Overall, with the mitigation measures, the intersection is forecast to operate with delays in the LOS C range or better with v/c ratios less than 0.85 during the peak hours.

A traffic signal is also expected to improve pedestrian and cycling safety by providing a control crossing of Burloak Drive.

7.5.4 Mainway at Sutton Drive

To accommodate for additional site-generated traffic from future phases, the following additional mitigation measures were implemented at the intersection of Sutton Drive at Mainway:

- Separate southbound left-turn and through-right lanes; and
- Separate westbound-right turn lane.

Reconfiguring the lane layout and signalizing the intersection is projected to improve the operations of the intersection. However, several movements are still projected to experience critical movements particularly during the weekday PM peak hour.

Delays can be attributed to the high traffic volumes along Mainway and Sutton Drive.

7.5.5 Mainway at Site Access B

A new site connection at Mainway and Site Access B is provided to accommodate for additional site generated traffic for the Office Park development located along Mainway, east of Sutton Drive. The following mitigation measures were implemented in the analysis:

- Implement an eastbound left-turn lane as per left-turn warrant.

Overall, operations are expected to be at acceptable levels with delays in the LOS C range or better during the peak hours.

7.6 Access Density

Access spacing for the full development has been assessed. Note that the future phases concepts are preliminary, not part of this application, and subject to change. As such the access locations may be adjusted in future concepts as the development progresses.

7.6.1 Arterial Intersection Spacing (Upper Middle Road and Burloak Drive)

Based on the Halton Region Access Management Guidelines[27], 300-400 m should be provided between intersections along arterial roads. It is recognized that characteristics of land parcels may not lend themselves to this level of spacing. As seen along Upper Middle Drive, the intersection spacing between Baker Drive, Deer Place, and Blue Spruce Road is less than 200 m.

Per the Transportation Association of Canada Geometric Design Guide for Canadian Roads[28] (TAC Guide) the recommended minimum intersection spacing along an Arterial Road is 200 m (Section 9.4.2.1). Accordingly, the Ontario Traffic Manual states that for an intersection/driveway to be considered for future signalization, a minimum spacing of 215 m for roads posted at 60 km/h or less and up to 350 m for roads posted at 80 km/h is recommended between adjacent signalized intersections.

Additionally, if it is recognized that characteristics of land parcels may not lend themselves to this level of spacing, reduced spacing of 100 m could be considered acceptable subject to restricted movements implemented (right in/out). However, a spacing of 30 to 60 metres can also be considered if the spacing is not conducive due to physical or economic reasons.

Based on the proposed connections to Upper Middle Road and Burloak Drive, the following is noted concerning intersection spacing:

- Corporate Drive at Burloak Drive is approximately 450 m south of Blue Spruce Avenue and Upper Middle Road and 335 m north of Site Access C. The spacing meets the minimum requirement for potential signalization.
- Site Access C at Burloak Drive is approximately 335 m south of Corporate Drive at Burloak Drive and 380 m north of Mainway at Burloak Drive. The spacing meets the minimum requirement for potential signalization.

[27] Halton Region, Access Management Guidelines, January 2015
[28] Geometric Design Guide for Canadian Roads, Transportation Association of Canada, 2017

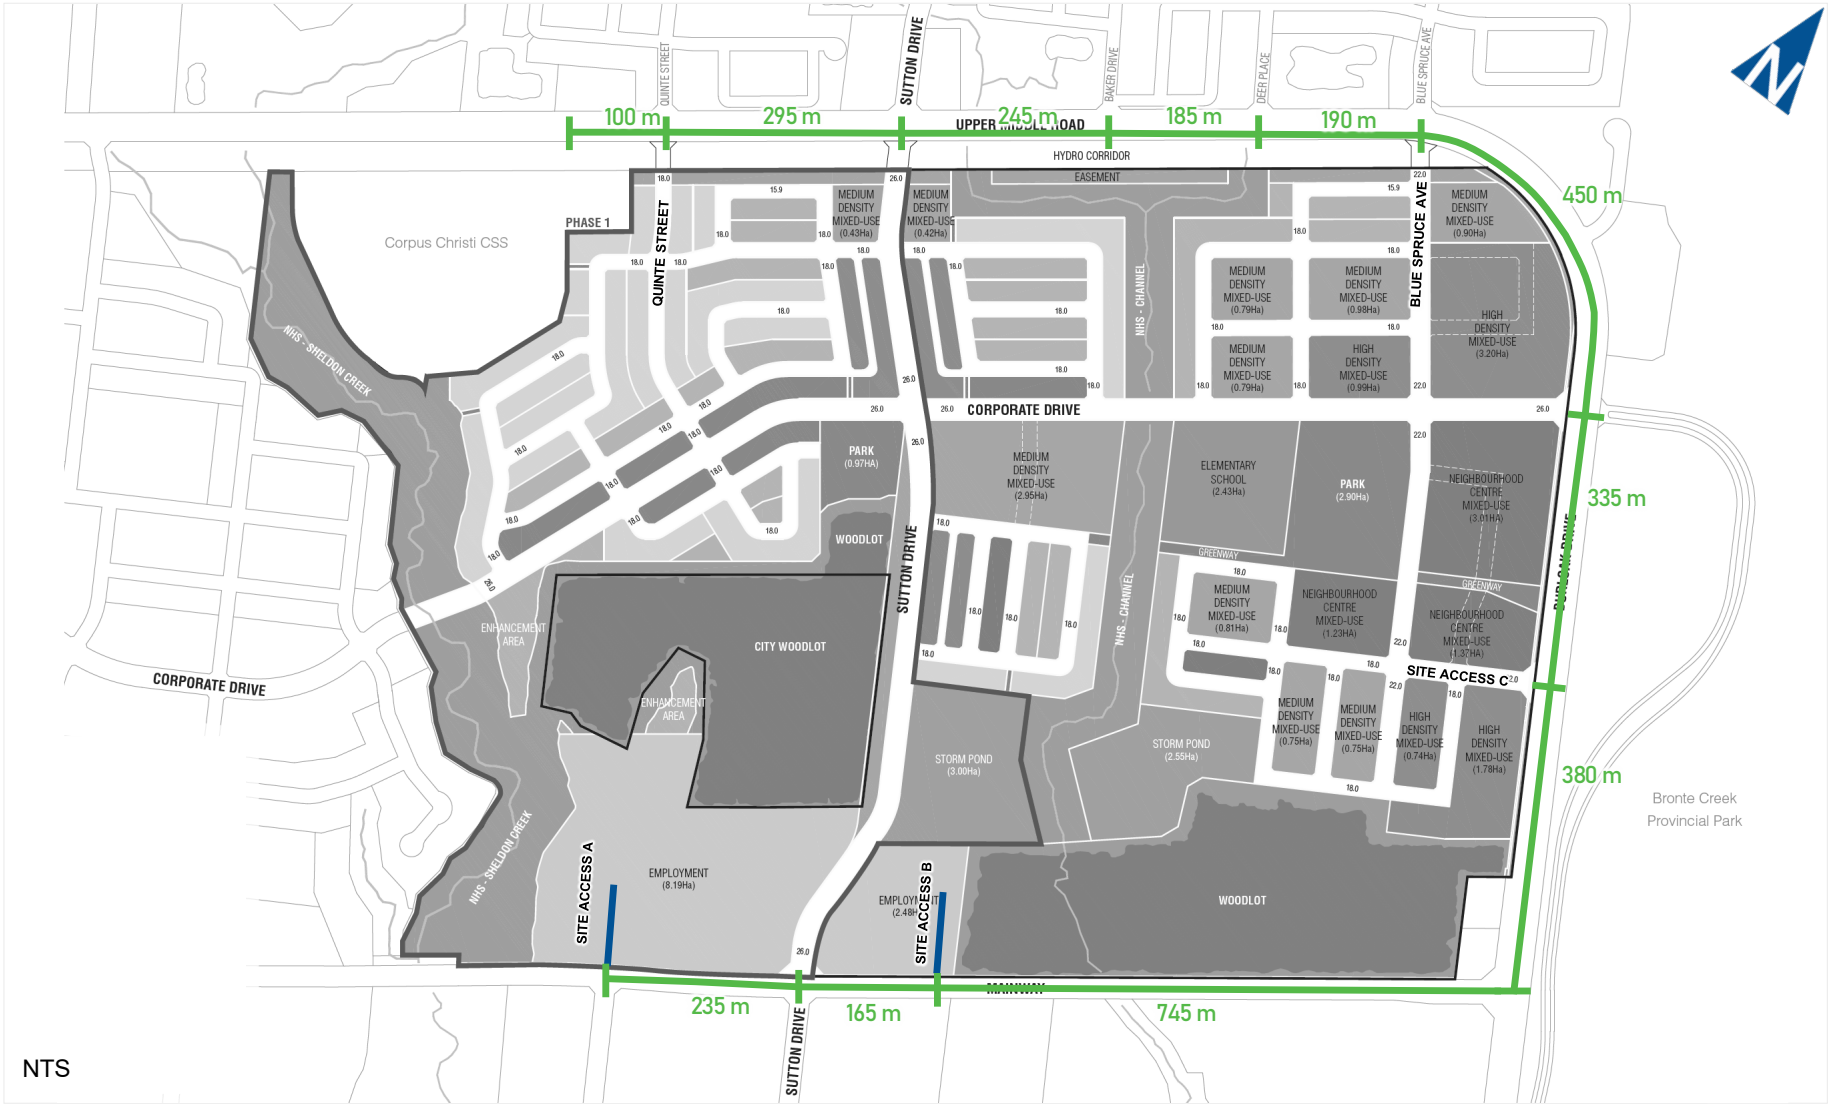
- Blue Spruce Avenue at Upper Middle Road is proposed to be 450 m north of Corporate Drive and 190 m east of Deer Place at Upper Middle Road. This existing spacing aligns with minimum spacing requirements to permit a full movement connection. The spacing does not meet the minimum requirement for potential signalization. However, a signalized intersection at Blue Spruce Avenue at Upper Middle Road should be considered given the future planned widening of Upper Middle Road to accommodate pedestrian crossings, provide an opportunity for safe cycling connections over the roadway, and improve access to the residential areas on Upper Middle Road's north and south sides.

7.6.2 Collector Intersection Spacing (Corporate Drive, Sutton Drive, Mainway)

Per the TAC Guide the recommended minimum intersection spacing along a Collector Road is 60 m (Section 9.4.2.2).

Based on the proposed connections, the following is noted concerning intersection spacing:

- Corporate Drive at Sutton Drive is approximately 330 m south of Upper Middle Road at Sutton Drive and meets the minimum spacing requirement along a collector road to permit full movements.
- Mainway at Sutton Drive is approximately 165 m west of Mainway at Site Access B and 265 m east of Mainway at Site Access A and meets the minimum spacing requirements to permit full movements.
- Mainway at Site Access A is 265 m west of Mainway at Sutton Drive and meets the minimum spacing requirements to permit full movements.
- Mainway at Site Access B is approximately 165 m east of Mainway at Sutton Drive and 745 m west of Mainway at Burloak Drive and meets the minimum spacing requirements to permit full movements.
- Internal roads throughout the development are generally spaced at least 60 m and meet the minimum spacing requirement along a collector road.



7.6.3 Local Roadways

The external and internal access points will comprise collector and local roads under the jurisdiction of the City of Burlington (i.e. public roads) and private roads facilitating property access within the blocks.

The TAC Guide was reviewed to determine the appropriateness of the access arrangement.

Preceding the analysis noted below, it can be summarized that the road system has been reviewed for general feasibility and found to be satisfactory.

Figure 7.10 illustrates the proposed spacing between the development access points.

Figure 7.10

7.7 Sight Line Assessment

The horizontal curve of Burloak Drive at Upper Middle Road potentially limits sight lines for the proposed site driveways at Blue Spruce Avenue and the Bronte Creek Park access (Street D). The sight distances at the roadways have been reviewed in accordance with the Transportation Association of Canada (TAC) Geometric Design Guide for Canadian Roads (GDGCR)[29].

The posted speed limit on Burloak Drive and Upper Middle Road is 60 km/h. A design speed of 70 km/h (10 km/h above the posted speed limit) has been used to calculate the required stopping sight distance (SSD), and intersection sight distance (ISD) for proposed site driveways.

SSD is the distance required for a vehicle approaching an intersection from either direction to perceive, react and come to a complete stop to avoid colliding with an object on the road; in this respect, SSD can be considered the minimum visibility criterion for the safe operation of an unsignalized intersection.

ISD is based on the time required for perception, reaction, and completion of the desired maneuver (typically, a left turn) once the driver on a minor street approach (or driveway) decides to execute the maneuver. The calculation for the critical ISD includes the time to (1) turn left and clear the near half of the intersection without conflicting with the vehicles approaching from the left; and (2), upon turning left, accelerate to the operating speed on the roadway without causing approaching vehicles on the main road to unduly reduce their speed. In this context, ISD can be considered the desirable visibility criterion for the operation of an unsignalized intersection. The ISD has been adjusted to account for Burloak Drive and Upper Middle Road being widened to three lanes in each direction.

Table 7.11 and Table 7.12 summarizes the sight distance measurement requirements set out in the TAC Guide for a design speed of 70 km/h. Sight distance is estimated using aerial imagery of the existing conditions and is measured from the approximate ultimate curb location. As the roadway is planned to be widened, sight lines may be altered with the reconstruction of the roadway.

7.7.1 Blue Spruce Avenue Access

To the northeast along Upper Middle Road, approximately 160 m of unobstructed sight distance within the right of way is available at the

[29] Geometric Design Guide for Canadian Roads, Transportation Association of Canada, 2017

proposed access across from Blue Spruce Avenue. To the northwest Burloak Drive, approximately 140 m of unobstructed sight distance within the right of way is available at the proposed access across from the Bronte Creek Park access.

Figure 7.11A illustrates the estimated sight distance from the Blue Spruce Avenue access.

The access location across from Blue Spruce Avenue meets and exceeds the prescribed intersection sight distances set out in the TAC Guide for a design speed of 70 km/h.[30]

7.7.2 Bronte Creek Park Driveway (Street D)

The access location across from the Bronte Creek Park access meets the prescribed intersection sight distances set out in the TAC Guide for a design speed of 70 km/h aside from the left turning movement. It should be noted that the unobstructed site distance measurements are only measured within the right-of-way. With minimal set-back on Block 429, 462, and 428 the sight lines are anticipated to meet TAC standards. The area should be kept clear of landscaping and other features that could limit driver sightlines.

Figure 7.11B illustrates the estimated sight distance from the Bronte Creek Park Driveway.

7.8 Full Build-Out Improvement Summary

In addition to the improvements identified for the Phase 1 development, improvements are proposed to mitigate future traffic operations at the study area intersections for the Full Build-Out of the subject lands. These improvements address conditions not previously identified in the Phase 1 improvements.

Figure 7.12 illustrates the proposed future lane configurations and traffic controls.

Table 7.13 summarizes the mitigation measures for improvement.

8 Neighbourhood Impacts

8.1 Infrastructure Impacts

The Ministry of Ontario released a guideline called "A Guideline for Highway Improvements Associated with Development[34]" to clarify who is responsible for roadway improvements when land use development requires it. This guide outlines the steps municipalities and stakeholders must follow when constructing improvements to a roadway, whether directly or indirectly. Although this guide is primarily intended for roads under Provincial jurisdiction, it provides valuable insight into the responsibilities involved in these projects.

Section 3A of the guideline outlines the following:

> *"Where a proposed Development will gain access to a provincial highway either directly by private entrance or by a new municipal road, the Proponent is responsible (financially or otherwise) for all warranted Highway Improvements, identified in the approved Traffic Impact Study. The Proponent is also responsible for any Highway Improvements that are not required immediately but that have been identified as being warranted in the future as a result of the Development. Any such future Highway Improvements are the responsibility (financially or otherwise) of the Proponent and must be addressed to MTO's satisfaction before MTO permits will be issued."*

Section 3C of the guideline outlines the following:

> *"Based upon MTO's review of a Proponent's Traffic Impact Study, it identifies a warrant for Highway Improvements based on existing and/or projected background traffic volumes. The Proponent would be responsible (financially or otherwise) for any additional Highway Improvements required over and above the existing and/or projected background traffic volumes, in order to accommodate the proposed Development traffic."*

Based on the above, the Applicant will be responsible for the costs related to new roadway connections to Upper Middle Road, Burloak Drive, and Mainway, which includes left turn lanes and potentially unwarranted traffic control signals. Moreover, the Applicant will bear the cost of potentially unwarranted traffic control signals due to the deterioration of operations at the intersection of Mainway at Sutton Drive. This is reflected based on the capacity of the intersections

[34] Ministry of Transportation Ontario, A Guideline for Highway Improvements Associated with Development, May 2005

projected to operate over capacity with the development build-out compared to operating within capacity under the no-build scenario (background horizon).

8.2 Neighbourhood Infiltration

Based on the road classification and network connectivity, most site traffic is expected to use Upper Middle Road, Burloak Drive, and Mainway to access the site.

Given the all-way stop control measures and anticipated travel time along external neighbourhood collector roads, such as Sutton Drive, it is unexpected that a substantial amount of site-generated traffic will infiltrate the adjacent neighbourhood subdivisions.

Although we do not foresee Sutton Drive (north of Upper Middle Road) or the potential Corporate Drive connection to be used significantly by development traffic, the Applicant may work with the community and undertake a traffic monitoring program once the proposed development is built out. The monitoring effort will focus on traffic patterns from the development through Sutton Drive and the potential Corporate Drive connection. If the results of the monitoring and subsequent analysis identify a significant portion of site traffic is travelling through the adjacent neighbourhoods, the Applicant will work with the City of Burlington to implement appropriate corrective measures. These may include the implementation of a Traffic Management Plan and additional traffic calming features on these existing roadways.

The monitoring study should begin 12 months (1 year) after the development is completed.

Thresholds for identifying the need for mitigation measures will depend on the type of study conducted. Potential measures may include a speed study to determine the presence of excessive speeding and/or licence plate traces to determine the proportion of site traffic using Sutton Drive or the potential Corporate Drive connection.

9 Transportation Demand Management

9.1 Proposed Measures

Transportation Demand Management (TDM) planning is intended to encourage sustainable transportation modes and minimize single-occupant vehicle trips as part of a community transportation management strategy. The design of the concept plan will provide the framework for TDM and facilitate establishing a higher priority for sustainable modes of transportation over single-occupant vehicles where appropriate. This relates to the internal road system, which is being designed to create TDM-supportive opportunities for the placement of buildings and public amenity spaces along the streets and at their intersections, desirable locations for building entrances and vehicular access, and well-defined pedestrian circulation routes and safer road crossings.

The use of transit places less reliance on personal automobiles for trips that can be completed with convenient and desirable transit options. Convenient and desirable transit can be provided by providing well-lit transit stops, seating, and weather-protective shelters. The subject site is currently served by four Burlington Transit routes that operate primarily on Upper Middle Road, Mainway, and Appleby Line and provide connections to Appleby GO, Burlington GO, and GO 407 Carpool Stations. The closest bus stops serving these routes are near site access intersections to major roadways such as Upper Middle Road, Appleby Line, and Mainway. The site layout will provide direct links connecting residents and visitors to nearby stops, making the development area more navigable towards local bus stops.

The development lands also lend themselves to TDM benefits associated with mixed or multi-use development. This form of development supports sustainability initiatives by promoting complementary land uses in close proximity. The primary effect is to allow locally generated trips to be made by foot, bike, public transit (including privately operated shuttles, taxis, uber, etc.), or private vehicle (car) while only travelling on the internal sidewalk, path or road networks (“internal capture trips”). Since car trips with local origins and destinations would not leave the development community, the potential traffic impact on the surrounding arterial road network (“external trips”) would be reduced.

As individual development blocks are build-out, TDM measures will be included in the site plan design and reviewed through the SPA process.

10 MMLOS Assessment

Intersection Level of Service (LOS) is a recognized metric for categorizing the delay experienced by drivers at intersections. The term “Level of Service” denotes how well a traffic movement operates under given traffic demands, lane arrangements, and traffic controls. It converts average delay at intersections into a scale from A to F, where A indicates the least delay and F indicates the greatest delay. The metric is extensively used in transportation planning, but it is limited to the experience of car drivers.

Multi-modal Level of Service (MMLOS) extends this concept to incorporate the experience of modes beyond car drivers. It converts a variety of factors into a scale from A to F for each mode; A indicates the best experience for users of that mode, and F shows the worst experience. As the output is a *set* of indicators, it reveals where changes have different (or opposite) effects on each mode.

The City of Burlington requested a MMLOS assessment for Mainway between Burloak Drive and Appleby line, as well as Sutton Drive between Mainway and John Lucas Drive during pre-consultation comments.

10.1 OTC MMLOS

The OTC MMLOS Guidelines[35] provide a methodology to assess the performance of all travel modes. The guidelines identify nine general street types for analysis. The guidelines were developed after reviewing national and international best practices in MMLOS analysis. **Table 10.1** outlines the roadway categories assumed for the study area intersections.

TABLE 10.1: MMLOS STREET TYPE CLASSIFICATION

Roadway	Classification	MMLOS Applicable Classification
Mainway (Burloak Drive and Appleby Line)	Industrial Connector	Industrial Connector
Sutton Drive (Mainway and John Lucas Drive)	Industrial Connector	Industrial Connector

[35] Dillion Consulting. *Multi-Modal Level of Service Guidelines*. (Toronto: Ontario Traffic Council, 2022)

10.1.1 Level of Service Target

Based on the street type, the MMLOS guidelines provide base LOS targets, ultimately identifying which modes should be prioritized. The base LOS targets for roadways within the study area are given in **Table 10.2**.

The level of service along segments for pedestrians is determined based on three criteria: facility width, buffer width and maximum distance between controlled crossings. Concerning cyclists, the criteria include facility width, buffer width and conflicts with other modes (in-lane conflicts and crossing point conflicts). Transit includes the facility type, passenger amenities, and pedestrian level of service. Level of service for trucks is based on the width of the curb lane and the car level of service. Car level of service contains criteria related to the mid-block v/c ratio and curb lane conflicts.

TABLE 10.2: MMLOS TARGETS PER STREET TYPE

Street Classification	Walking	Cycling	Transit	Trucks	Cars
Industrial Connector	E	D	D	B	D

10.1.2 Mainway MMLOS Segment Analysis

Table 10.3 summarizes the MMLOS analysis for the segment of Mainway between Appleby Line and Burloak Drive. The existing and future conditions for the segment's lengths are assumed to be the same and are considered in a single row.

Pedestrian MMLOS along Mainway is in the D range meeting and exceeding the target grade. Mainway from Lampman Avenue to Burloak Drive in the westbound direction does not pass the design check (i.e. pedestrian facilities required), assessing the target level is not feasible.

Regarding the cycling MMLOS, as Mainway does not pass the design check (i.e., at a minimum protected facility is required), assessing the target level is not feasible.

Transit MMLOS along Mainway is in the E range, one grade below the target. This could be improved by providing passenger amenities such as shelters, seating, or shade trees, or by improving pedestrian MMLOS.

Truck MMLOS along Mainway is in the B range meeting the target grade.

Car MMLOS along Mainway is within the A to C range meeting and exceeding the target grade.

10.1.3 Sutton Drive MMLOS Segment Analysis

Table 10.3 summarizes the MMLOS analysis for the segment of Sutton Drive between Mainway and John Lucas Drive. The existing and future conditions for the segment's lengths are assumed to be the same and are considered in a single row.

Pedestrian MMLOS along Sutton Drive is in the LOS E range in the northbound direction, meeting the target grade. Sutton Drive in the southbound direction does not pass the design check (i.e. pedestrian facilities required), assessing the target level is not feasible.

Regarding the cycling MMLOS, as Sutton Drive does not support any cycling facilities, it does not pass the design check (i.e., at a minimum protected facility is required), assessing the target level is not feasible.

Transit MMLOS along Sutton Drive is in the F range, for both sides of the roadway. This could be improved by providing passenger amenities such as shelters, seating, or shade trees, or by improving pedestrians MMLOS.

Truck MMLOS along Sutton Drive is in the B range meeting the target grade.

Car MMLOS along Mainway is in the LOS B range, exceeding the target grade of LOS D.

TABLE 10.3: MMLOS SEGMENT ANALYSIS

Direction	Segment	Walking	Cycling	Transit	Trucks	Cars
NB	Sutton Drive (Mainway to John Lucas Drive)	E	N/A	F	B	B
SB	Sutton Drive (Mainway to John Lucas Drive)	N/A	N/A	F	B	B
EB	Mainway (Appleby Line to Lampman Avenue)	D	N/A	E	B	A
	Mainway (Lampman Avenue to Burloak Drive)	D	N/A	E	B	C
WB	Mainway (Appleby Line to Lampman Avenue)	D	N/A	E	B	A
	Mainway (Lampman Avenue to Burloak Drive)	N/A	N/A	E	B	C

11 Conclusions and Recommendations

11.1 Conclusions

Transportation Impact Assessment

The proposed Phase 1 development will generate approximately 934 new vehicle trips during the weekday AM peak hour, 960 new vehicle trips during the weekday PM peak hour, and 631 new vehicle trips during the Saturday peak hour

Detailed traffic analysis was conducted for each of the study area intersections under Base (2024), 2035, 2040, and 2045 traffic conditions. The capacity analysis showed that deficiencies currently exist and are projected to occur at certain locations within the study area with anticipated growth in traffic, including the proposed development.

Increasing the intersection capacity through additional through lanes or dedicated turn lanes may not be feasible or desirable for an active transportation-friendly roadway cross-section. If capacity of the intersection cannot be increased, then the demand (traffic volume) will need to be decreased through TDM and alternative modes of transportation.

The following capacity constraints at the study area intersections are identified.

Appleby Line at Dundas Street

Horizon Year	Operations
2024 Base Year	Approaching Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

During the Base Year, several movements are approaching capacity during the peak hours. Under the future Background horizon, several movements are forecast to experience critical movements including the westbound left-turn lane as well as the northbound through.

With the addition to site generated traffic, the projected critical movements are expected to worsen under the future Total horizons

and near-capacity movements such as the northbound left and southbound through, are forecast to have v/c ratios above the critical thresholds.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Despite applying these mitigation measures, several movements are still projected to exceed capacity with a v/c ratio exceeding 1.00 and operate with LOS F, primarily due to high traffic volumes along Appleby Line and Dundas Street.

Appleby Line at Upper Middle Road

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are present in the Base Year operations for several movements including the eastbound left, eastbound through-right, westbound through, westbound right, southbound through-right, and southbound left-turn lanes throughout the weekday and Saturday peak hours, operating at LOS C-E and queues exceeding storage at the left-turn lanes. It is forecast that these movements will further deteriorate under the future Background and Total conditions, ultimately operating at LOS E-F with v/c ratios greater than 1.00 during the weekday and Saturday peak hours.

To accommodate projected traffic volumes, double westbound left and southbound left-turn lanes were added with protected phasing and the existing traffic signal cycle times were adjusted.

With the implementation of these mitigation measures, delays are expected to be reduced by over 280 seconds for the eastbound approach, westbound approach, northbound approach, and the southbound left-turn lane during the weekday and Saturday peak hours. Despite these reductions, several of the movements are still projected to exceed capacity with a v/c ratio exceeding 1.00, as well as queues exceeding the available storage at exclusive turn lanes primarily due to high traffic volumes along Appleby Line and Upper Middle Road.

Upper Middle Road at West School Driveway/Private Driveway

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Within Capacity
2035 Total	Within Capacity
2040 Background	Within Capacity
2040 Total	Within Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

It is anticipated that under the Background conditions, critical movement is noted in the 2045 Background horizon in the northbound through-left lane operating at LOS E with a v/c ratio of 0.85 during the weekday AM peak hour.

Under the 2045 Total horizon, the eastbound through-right lane is forecast to worsen, operating at LOS D with a v/c ratio greater than 0.85 during the weekday AM peak hour.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted, in addition to the widening of Upper Middle Road.

With these mitigation measures, under the 2045 future Total horizon, the northbound through-left lane can see a reduction in delays by 51 seconds, with a v/c ratio less than 0.70 during the weekday AM peak hour. However, the eastbound through-right lane is still projected to be a critical movement as the v/c ratio exceeds 0.85, primarily due to high traffic volumes along Upper Middle Road.

Upper Middle Road at East School Driveway

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Currently, the northbound left-turn lane operates at LOS F and LOS D during the weekday AM and PM peak hours respectively. All other lanes operate at acceptable conditions at LOS B or better.

Under Background conditions, the westbound left-turn lane 95th percentile queues are forecast to exceed the available storage.

The addition of site-generated traffic is forecast to significantly increase delays for the northbound left-turn movement due to the lack of capacity from background traffic growth.

Upper Middle Road at Quinte Street

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under existing conditions, critical movement is observed in the southbound left-turn lane, operating at LOS F with a v/c ratio greater than 1.00 during the weekday AM peak hour.

Under the Background conditions, the operations of the southbound left-turn lane are forecast to worsen during the weekday PM and Saturday peak hours, operating at LOS D-E.

Under future Total conditions, during the weekday AM peak hours, the northbound approach is forecast to degrade to LOS F with critical delays and v/c ratios significantly exceeding 1.00.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Signalize the intersection (OTM Warrants Not Satisfied – Signalization recommended based on operational considerations);
- Separate eastbound left-turn lane; and
- Separate left-turn lanes for the northbound and southbound approaches with protected-permissive left-turn phases.

With these mitigation measures, a significant reduction in delays in the northbound and southbound movements are noted during the weekday and Saturday peak hours, improving to LOS C or better, with v/c ratios less than 0.30. Critical movement is note in the westbound approach with delays in the LOS D-E range during the weekday and Saturday

peak hours with a v/c ratio over 0.95 due to high traffic volumes along Upper Middle Road.

Upper Middle Road at Sutton Drive

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movement is noted in the westbound through-right lane during the weekday PM peak operating at LOS C with a v/c ratio of 0.85.

By the 2035 Background horizon, the intersection is projected to experience critical movements including the eastbound left-turn lane (LOS F, v/c > 1.00) with queues exceeding storage by up to 35 m, and the southbound approach (LOS E, v/c > 1.00) during weekday peak hours.

It is anticipated that during the future Total horizon, the westbound approach will degrade to LOS F with a v/c ratio over 1.00 during the weekday AM and Saturday peak hours, as well as in the southbound approach during the weekday PM and Saturday peak hours.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Double southbound left-turn lanes;
- Northbound left-turn lane and protected-permissive phase;
- Westbound left-turn lane and protected-permissive phase; and
- Optimizing the timing of traffic signals.

Despite this, the eastbound and southbound left-turn lanes are expected to continue to experience queues greater than the available storage. The westbound through-right lane is still expected to operate with a v/c ratio exceeding 0.85 during the weekday PM peak hour, due to high traffic volumes along Upper Middle Road.

Upper Middle Road at Baker Drive

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Within Capacity
2035 Total	Within Capacity
2040 Background	Within Capacity
2040 Total	Within Capacity
2045 Background	Within Capacity
2045 Total	Within Capacity

Individual movements at the intersection of Upper Middle Road at Baker Drive presently operate at LOS C or better during the weekday peak hours. Similar levels of operation are expected under future Background and Total conditions with only a minor increase in delay resulting from background traffic growth

Upper Middle Road at Deer Place

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

At Upper Middle Road at Deer Place, movements during the weekday peak hour currently operate at acceptable conditions, with the exception being the southbound approach, operating at LOS D during the weekday PM peak hour.

Under the 2045 Background horizon, the southbound approach is forecast to degrade to LOS D during the weekday AM peak hour with a minor increase in delays from background traffic growth.

Total conditions operate similar to background with only a minor increase in delay resulting from site traffic.

Upper Middle Road at Blue Spruce Avenue

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under existing conditions, the southbound approach operates at LOS D-F range during the weekday AM/PM and Saturday peak hours. Operations are projected to further degrade with Background traffic growth. Under Background conditions, the eastbound left-turn lane is expected to degrade to LOS D during the weekday PM peak hour. The southbound approach is also forecast to further degrade to LOS F during the weekday and Saturday peak hours with v/c ratios exceeding 1.00 due to increased delays from eastbound/westbound traffic growth along Upper Middle Road.

Total conditions operate similar to background with only a minor increase in delay resulting from site traffic.

Adjustments to the roadway geometry should be considered to accommodate projected background traffic volumes. Some possible upgrades include implementing the following:

- Signalize the intersection (OTM Warrants Not Satisfied – Signalization recommended based on operational considerations).

These adjustments are forecast to improve the operation of the southbound movement during the weekday and Saturday peak hours, operating at LOS B or better with Delays projected to be less than 20 seconds. In addition to delay reduction, signalization of this intersection provides a controlled crossing for pedestrians and cyclists.

Burloak Drive at Bronte Creek Park Access

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under existing conditions, the westbound approach currently operates at LOS F during the weekday PM peak hour, with delays of less than 70 seconds.

Performance expected to further deteriorate under future Background scenarios due to background growth. Under Background conditions, this movement is also projected to degrade to LOS F during the Saturday peak hour. Additionally, during the weekday PM peak hour, the southbound left-turn movement is forecast to decline to LOS D.

Total conditions operate similar to background with only a minor increase in delay resulting from site traffic.

Adjustments to the roadway geometry should be considered to accommodate projected background traffic volumes. Some possible upgrades include implementing the following:

- Signalize the intersection (OTM Warrants Not Satisfied – Signalization recommended based on operational considerations).

These adjustments are forecast to improve the operation of this intersection, with all movements operating at LOS C or better, with delays less than 30 seconds during the weekday and Saturday peak hours. The westbound approach during the weekday PM peak hour will see the largest reduction in delays, with delays at 28 seconds and v/c ratio of less than 0.45.

A traffic signal is also expected to improve pedestrian and cycling safety by providing a control crossing of Burloak Drive.

Burloak Drive at Mainway

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under Background conditions, the northbound left-turn lane degrades to a LOS F with a v/c ratio exceeding 1.00 during the weekday AM and PM peak hours, with queue lengths exceeding the available storage by less than 80 m and 140 m respectively. The eastbound right-turn lane is also projected to experience critical delays at LOS F and v/c ratio grater than 0.95 during the weekday AM peak hour.

Under the future Total horizon, the eastbound right-turn lane is also anticipated to operate in the LOS F range with a v/c ratio exceeding 1.00 and significant delays resulting from site-generated traffic, during the weekday PM peak hour.

Adjustments to the roadway geometry are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Optimize signal cycle times of the existing traffic signals; and
- Double northbound-left turn lanes with protected phase.

Traffic signal adjustments and implementing double northbound left-turn lanes is forecast to improve operations of the eastbound and northbound approaches during the weekday and Saturday peak hours. However, the northbound left-turn lane will still exceed the available storage by approximately 40 m due to the high traffic volumes along Burloak Drive and Mainway.

It is noted that double northbound left-turn lanes may not be feasible as the intersection may already be at the ultimate cross-section width with the widening of Burloak Drive. In addition, adding lanes may not be desirable as increasing roadway width can have negative impacts to pedestrian and cycling environments.

To avoid such area intense mitigation measures, the reduction of future growth and single occupant vehicles is required. An increased modal split will need to be considered to decrease the number of single

person vehicle trips, which the site will also support through TDM measures to improve active transportation and accessibility.

Mainway at Sutton Drive

Horizon Year	Operations

2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under Background conditions, the northbound approach will likely operate in the LOS E range and degrade under future horizons with background traffic.

Under future Total conditions, critical movements are forecast in the northbound and southbound approaches during the weekday and Saturday peak hours and, operating at LOS F with a v/c ratio greater than 1.00.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Signalizing the intersection (OTM Warrants Satisfied); and
- Eastbound left-turn lane with a protected-permissive phase.

Reconfiguring the lane layout and signalizing the intersection is projected to improve the operations of the intersection. During the weekday and Saturday peak hours, all movements are expected to operate with LOS B or better with v/c ratios less than 0.85, with the exception being the southbound approach during the weekday PM peak hour operating at LOS D with a v/c ratio over 0.85. However, this mitigation measure is still expected to provide a substantial improvement, as the southbound approach improves from excessive delays and a v/c ratio exceeding 3.00 to tolerable conditions. Delays can be attributed to the high traffic volumes along Mainway and site traffic along Sutton Drive.

Mainway at Norjohn Court/Lampman Avenue

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the northbound and southbound approaches during the weekday peak hours, operating at LOS D-E. Under future Background and Total horizons, these movements are projected to degrade to LOS F with significant delays and v/c ratios exceeding 1.00.

To accommodate projected traffic volumes, traffic signals can be implemented to the existing stop-controlled intersection.

- Signalizing the intersection (OTM Warrants Not Satisfied – Signalization recommended based on operational considerations).

The signal warrant analysis indicates traffic control signals are not warranted under the 2045 horizon. Even though the signal criteria have not been met, installing unwarranted traffic control signals would improve operations.

With signalization, northbound and southbound approaches are forecast to have delays reduced by up to 449 seconds during the weekday peak hours.

Additional turn lanes with unsignalized intersection were tested but were not found to reduce the delays. As the delays stem from the high volume of eastbound/westbound traffic, northbound and southbound movements require controlled gaps to complete manoeuvres

Appleby Line at Mainway

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the westbound through-right and northbound left-turn lanes, operating at LOS F with v/c ratios greater than 1.00 during the weekday PM peak hour.

Under Background conditions, the eastbound left is forecast to operate with v/c ratios exceeding 0.95, as well as queues exceeding the available storage for the left-turn lane.

Several movements are forecast to worsen under Total conditions, including the eastbound left, eastbound through-right, westbound left, northbound through-right, southbound left, and southbound through-right lanes throughout the weekday and Saturday peak hours.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Adjusting the signal timings are anticipated to significantly improve operations for all movements by reducing delays during the weekday AM peak hour. Although, critical movements are still expected in the eastbound left, westbound through-right, northbound left, northbound through-right, and southbound through-right movements due to high traffic volumes, the proposed measures are anticipated to reduce delays by up to 299 seconds during the weekday PM peak hour as well.

Additional measures have been tested, including increasing queue storage. Increasing road capacity by adding travel lanes may not be feasible as the intersection may already be at the ultimate cross-section width with the widening of Appleby Line. In addition, adding lanes may not be desirable as increasing roadway width can have negative impacts to pedestrian and cycling environments. The reduction of future growth and single occupant vehicles is required.

Appleby Line at Corporate Drive

Horizon Year	Operations
2024 Base Year	Within Capacity

2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under the Background conditions, critical movement is projected for the westbound approach, operating at LOS E with a v/c ratio of 0.85 during the weekday PM peak hour, and is expected to worsen under future Total conditions.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Adjusting the signal timings is anticipated to slightly improve operations for the westbound approach by improving the v/c ratio to less than 0.85 during the weekday PM peak hour. Despite these reductions, critical movements are still noted in the westbound and northbound through-right movements during the weekday PM peak hour due to high traffic volumes along Appleby Line.

Burloak Drive at North Service Road

2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Under Background conditions, critical movements are forecast in the northbound left-turn lanes during the weekday AM peak hour, operating at LOS F with v/c ratios exceeding 1.00.

With increased traffic volumes in the future Total horizon, the eastbound right-turn lane is forecast to degrade to LOS F with a v/c ratio greater than 1.00 during the weekday PM peak hour and the northbound through lane is anticipated to operate with a v/c ratio of 0.85 during the weekday PM peak hour.

To accommodate projected traffic volumes, double northbound left-turn lanes can be implemented along Burloak Drive.

Adjusting the lane configuration and signal timings are anticipated to improve operations for the northbound left-turn lane during the weekday AM peak hour by reducing delays by up to 164 seconds. During the weekday PM peak hour, delays in the eastbound right-turn lane are expected to improve by up to 153 seconds. However, critical movements are still projected at the intersection due to high traffic volumes along Burloak Drive.

Burloak Drive at QEW Westbound Off-Ramp

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the westbound approach during the weekday and Saturday peak hours, operating at LOS D-F with v/c ratios exceeding 1.00. Delays are projected to worsen with Background traffic growth and site-generated traffic, and the queues are forecast to extend beyond the available storage. The southbound approach is also forecast to operate with a v/c ratio exceeding 1.00 during the weekday PM peak hour.

Under the 2045 Background horizon, the westbound ramp left and right-turn 95th percentile queue lengths are forecast to extend between 325 and 865 m back during the peak hours and are forecast to spill back to the mainline. However, SimTraffic queuing analysis estimates 95th percentile queue lengths are forecast to extend up to 350 m back during the weekday PM peak hour and is not expected to reach the bullnose, located approximately 500 m.

Under Total conditions, the northbound approach will operate with a v/c ratio exceeding 0.85 during the weekday peak hours. The southbound approach is expected to operate with a v/c ratio greater than 0.85 during the weekday peak hours, under the 2045 Total horizon.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Separating the existing westbound left-right turn lane to double left and right turn lanes; and
- Optimizing the timing of traffic signals.

Implementing these measures are forecast to significantly reduce delays during the weekday and Saturday peak hours. Despite the significant delay reductions, capacity issues are still expected. The movements still exceeding capacity includes the westbound approach, northbound, and southbound approaches due to the high traffic volumes along Burloak Drive during the future horizon.

Burloak Drive at QEW Eastbound Off-Ramp/Red Oak Boulevard

Horizon Year	Operations
2024 Base Year	Within Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Individual movements at the intersection of Burloak Drive at the QEW Eastbound Off-Ramp presently operate at acceptable conditions, with a LOS D or better for all movements.

Under the Background horizon, the southbound approach is projected to experience with a v/c ratio greater than 0.90 during the weekday PM peak hour.

Under future Total conditions, critical movements are forecast in the eastbound left-turn lane, operating at LOS D range with a v/c ratio over 0.75 during the weekday AM peak hour and Saturday peak hours.

The eastbound left-turn 95th percentile queue length is forecast to extend over up to 105 m back during the weekday AM peak hour. Ramp queues are not expected to reach the bullnose, located approximately 450 m, and are not forecast to spill back to the mainline.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Converting the eastbound through lane to a through-left lane; and
- Optimize the timing of traffic signals.

The adjustments to the lane configuration and signal timings are projected to improve operations during the weekday and Saturday peak hours. The southbound approach is expected to operate with delays reduced by up to 37 seconds. Despite these reductions, critical movements are still anticipated due to high traffic volumes along Burloak Drive.

Appleby Line at North Service Road

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

In the Base Year, a critical movement is observed in the westbound left-turn lane, operating at LOS F with a v/c ratio greater than 0.95 and queues exceeding the available storage during the weekday PM peak hour.

Under Background conditions, critical movements are forecast in the eastbound left, westbound through-right, and northbound approach during the weekday PM peak hours, operating with v/c ratios greater 0.95 and queues exceeding storage for the left-turn lanes.

With increased traffic volumes in the future Total horizon, the northbound and southbound through-right lanes are projected to operate with v/c ratios exceeding 0.85 during the weekday peak hours.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Adjusting the signal timings are anticipated to improve operations for the northbound left-turn and southbound through-right lane by reducing delays by up to 34 seconds. However, critical movements are still projected at the intersection due to high traffic volumes at the intersection.

Appleby Line at QEW Westbound Off-Ramp

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the westbound right-turn lane during the weekday PM peak hour, operating at LOS F with v/c ratios exceeding 1.00.

Under Background conditions, the northbound approach is also projected to operate with v/c ratios above 0.85 during both weekday peak periods. In the weekday AM peak hour, the westbound right-turn lane is expected to worsen to LOS F with a v/c ratio greater than 1.00. Additionally, during the weekday PM peak hour, the westbound left-turn lane is forecast to degrade to LOS F, with a v/c ratio exceeding 1.00. The westbound left and right-turn 95th percentile queue lengths are forecast to extend between 315 and 865 m back during the weekday PM peak hour and are forecast to spill back to the mainline.

However, SimTraffic queuing analysis estimates 95th percentile queue lengths are forecast to extend up to 350 m back during the peak hours and is not expected to reach the bullnose, located approximately 500 m .

The southbound approach is expected to operate with v/c ratios above 0.90 during the weekday PM peak hour, and above 0.85 during the AM peak hour. Overall, delays are anticipated to worsen under Total conditions with the addition of site-generated traffic.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Double westbound right-turn lanes; and
- Optimize the timing of traffic signals.

Implementing these measures are forecast to significantly reduce delays in the westbound approach and the northbound approach. During the weekday PM peak hour, despite delay reductions of up to 850 seconds in the westbound approach, capacity issues are still

expected. The movements still exceeding capacity includes the westbound left-turn, westbound right-turn, northbound, and southbound approaches due to the high traffic volumes at Appleby Line at QEW Westbound Off-ramp. With the mitigation measures, queuing on the QEW westbound off-ramp is not expected to impact the mainline operations.

Appleby Line at QEW Eastbound Off-Ramp

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Base year scenario show critical operations for the eastbound left-turn off-ramp movement which operates with a v/c of 0.75 during the weekday AM peak hour.

Under Background conditions, the eastbound right-turn lane is forecast to operate with queues exceeding the available storage during the peak hours. The 95th percentile queue is forecast to extend beyond the available storage by less than 55 m and is not expected to reach the bullnose located approximately 415 m away.

Under future Total conditions, the eastbound left-turn lane is forecast to degrade to LOS E with a v/c ratio over 0.95 during the weekday AM peak hour. The eastbound left-turn lane is forecast to have queues exceeding the available storage by less than 15 m during the weekday AM peak hour but is not expected to reach the bullnose located approximately 415 m away.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Implementing these measures are forecast to reduce delays by up to 18 seconds in the eastbound approach during the weekday and Saturday peak hours. During the PM peak hour, delays are reduced by up to 44 seconds in the southbound approach. However, these movements are still projected to operate as critical movements due to high traffic volumes at the intersection.

Although queuing is forecast to extend beyond the available storage, queues are not expected to impact QEW mainline highway operations.

Appleby Line at Harvester Road

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are observed in the eastbound left-turn and westbound through-right lane, operating at LOS F with v/c ratios greater than 0.95. The westbound left-turn lane operates at LOS E-F during the weekday PM and Saturday peak hours with a v/c ratio greater than 0.90. The southbound left-turn lane also exhibits queues exceeding the available storage during the weekday AM peak hour. These movements are anticipated to degrade with future traffic growth.

With background traffic growth, critical operations are forecast for the eastbound through-right lane under the 2040 horizon during the weekday PM peak hours, operating at LOS E with a v/c ratio greater than 0.85.

Under the Total conditions, the eastbound left-turn lane will degrade to LOS F with v/c ratios greater than 0.95 during the weekday AM and Saturday peak hours. The northbound and southbound through lanes are also expected to operate with v/c ratios exceeding 0.85 during the weekday AM and PM peak hours respectively.

Adjustments to the roadway geometry and traffic control are necessary to accommodate projected traffic volumes. Some possible upgrades include implementing the following:

- Double southbound left-turn lanes with a protected phase; and
- Optimize the timing of traffic signals.

Implementing these measures are forecast to significantly reduce delays in the eastbound and in the westbound approach during the weekday and Saturday peak hours. However, the eastbound left, westbound approach, northbound through, northbound right, southbound left and southbound through lanes are still projected to operate as critical movements due to high traffic volumes at the intersection.

Double northbound left-turn lanes may not be feasible and may not be desirable as increasing roadway width can have negative impacts to pedestrian and cycling environments.

Appleby Line at Fairview Street

Horizon Year	Operations
2024 Base Year	Exceeding Capacity
2035 Background	Exceeding Capacity
2035 Total	Exceeding Capacity
2040 Background	Exceeding Capacity
2040 Total	Exceeding Capacity
2045 Background	Exceeding Capacity
2045 Total	Exceeding Capacity

Critical movements are present at the eastbound and southbound right-turn lanes, operating at LOS D and B with 95th percentile queue lengths exceeding the available storage by less than 70 m.

Under future Background conditions, the eastbound left-turn, northbound left-turn and southbound through lanes are forecast to operate as critical movements, at LOS D-F with 95th percentile queues exceeding the storage for left-turning movements, during the weekday peak hours. The southbound left-turn lane will also operate with queues exceeding the storage during the weekday AM peak hour. The northbound through movement is forecast to operate with delays in the LOS D range or worse and a v/c ratio greater than 0.90 during the AM peak hour.

These movements are projected to worsen with the addition of site-generated traffic under Total conditions, deteriorating to LOS D-F.

To accommodate projected traffic volumes, the existing traffic signal cycle times were adjusted.

Despite applying these mitigation measures, several movements are still projected to exceed capacity with a v/c ratio exceeding 1.00, as well as queues exceeding the available storage at exclusive turn lanes primarily due to high traffic volumes along Appleby Line and Fairview Street.

Mainway at Site Access A

Horizon Year	Operations
2035 Total	Within Capacity
2040 Total	Within Capacity
2045 Total	Within Capacity

A new site connection at Mainway and Site Access A is provided to accommodate for additional site generated traffic for the healthcare and institutional development located along Mainway. Individual movements at the intersection of Site Access A at Mainway is expected to operate at acceptable conditions under the future Total conditions, with a LOS C or better for all movements.

Sutton Drive at Corporate Drive

Horizon Year	Operations
All Total Horizons	Within Capacity

At the all-way stop-controlled internal site intersection of Sutton Drive at Corporate Drive, all approaches are forecast to operate within capacity with a LOS A or better during the weekday and Saturday peak hours.

As per comments from the City, alternative traffic control is considered including signalization and roundabout configurations. All three intersection controls are expected to accommodate vehicle traffic without issue. However, considering the land requirements and pedestrian crossings, an all-way stop controlled intersection control is recommended.

Full Build-Out Assessment

The full build-out is anticipated to be completed in a horizon beyond Year 2045 (10 years after Phase 1 Build-Out), at an unknown time.

The concept shows Phases 2 to 4 located between Sutton Road and Burloak Drive. The development application is for the Phase 1 lands only. However, to provide a high-level long-range assessment of the potential road improvements required to accommodate the possible development, a Full Build-Out scenario has been assessed.

The Full Build-Out stats are based on high-level assumptions of development densities, community needs, and are subject to change.

Under the 2045 horizon year, many study area intersections are forecast to operate at or near their functional capacity. Since the Full Build-Out site traffic assignment adheres to the same methodology utilized in Phase 1, the majority of impacted movements have already been identified, with appropriate mitigation measures previously proposed to address these constraints.

Overall, the study area intersections are forecast to operate at similar levels to the Phase 1 2045 Total Scenario; the exceptions being the new site access intersections for the future phases. The following capacity constraints at the new site access intersections are identified.

Upper Middle Road at Blue Spruce Avenue

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

Under Full Build-Out of the site, Blue Spruce Avenue is proposed to extend south of Upper Middle Road to provide access to the development. With Phase 1 mitigation measures, the intersection has been assumed to be signalized by Full Build-Out. With site-generated traffic volumes, the westbound approach is forecast to operate at LOS C and v/c ratios exceeding 0.95 during the weekday PM peak hour.

To accommodate for the additional Full Build-Out site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Signalizing the intersection (OTM Warrants satisfied); and
- Left-turn Lane and protected-permissive phase for westbound traffic.

Overall, signalization is recommended to reduce delays for northbound and southbound approaches and support walkability in the study area.

Burloak Drive at Corporate Drive/ Bronte Creek Park Access

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

With future phases of the development, Corporate Drive is proposed to be extended east through the development lands, providing a new access to site from the existing Burloak Drive at Bronte Creek Park intersection. The intersection has been assumed to be signalized under the Phase 1 mitigation measures.

The addition of site-generated traffic degrades the northbound approach to operate with delays in the LOS A-E range and a v/c ratio greater than 0.90 during the peak hours.

To accommodate for the additional Full Build-Out site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Signalizing the intersection (OTM warrants satisfied); and
- Implement a left-turn lane and phase for northbound traffic.

In the Phase 1 mitigation measures, signalization was identified as potential improvement although the signal was unwarranted. With the Full Build-Out of the site, the signal is warranted. Overall, with the mitigation measures, the intersection is forecast to operate with delays in the LOS D range or better with v/c ratios less than 0.85 during the peak hours.

A traffic signal is also expected to improve pedestrian and cycling safety by providing a control crossing of Burloak Drive.

Burloak Drive at Site Access C

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

A future connection at Burloak Drive at Site Access C is planned to provide additional access to the development, located south of the Burloak Drive at Bronte Creek Park/Corporate Drive intersection. Under the assumed two-way stop-control, the eastbound approach is forecast to operate with delays in the LOS F range.

To accommodate for the additional Full Build-Out site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Signalizing the intersection (OTM warrants not satisfied);
- Northbound left-turn lane as per left-turn warrant;
- Northbound left-turn protected-permissive phase; and
- Separate eastbound left-turn and right-turn lanes.

Overall, with the mitigation measures, the intersection is forecast to operate with delays in the LOS C range or better with v/c ratios less than 0.85 during the peak hours.

A traffic signal is also expected to improve pedestrian and cycling safety by providing a control crossing of Burloak Drive.

Mainway at Sutton Drive

Horizon Year	Operations
2045 Total (Full Build-Out)	Exceeding Capacity

The Full Build-Out scenario is forecast to operate similarly to the Phase 1 2045 horizon. Even with Phase 1 mitigation measures, several movements are still projected to experience critical movements including the eastbound left, westbound through-left, northbound approach, and southbound approach.

To accommodate for the additional Full Build-Out site-generated traffic volumes, the following mitigation measures were incorporated in the analysis:

- Separate southbound left-turn and through-right lanes; and
- Separate westbound-right turn lane.

Reconfiguring the lane layout and signalizing the intersection is projected to improve the operations of the intersection. However, several movements are still projected to experience critical movements particularly during the weekday PM peak hour.

Delays can be attributed to the high traffic volumes along Mainway and Sutton Drive.

Mainway at Site Access B

Horizon Year	Operations
2045 Total (Full Build-Out)	Within Capacity

A new site connection at Mainway and Site Access B is provided to accommodate for additional site generated traffic for the Office Park development located along Mainway, east of Sutton Drive. The following mitigation measures were implemented in the analysis:

- Implement an eastbound left-turn lane as per left-turn warrant.

Overall, operations are expected to be at acceptable levels with delays in the LOS C range or better during the peak hours.

Neighbourhood Impact Assessment

To support the development, the Applicant will be responsible for the costs related to new roadway connections to Upper Middle Road, Burloak Drive, and Mainway, which includes left turn lanes and traffic control signals. Moreover, the Applicant will bear the cost of potentially unwarranted traffic control signals due to the deterioration of operations at the intersection of Upper Middle Road at Blue Spruce Avenue, Burloak Drive at Site Access A, Burloak Drive at Corporate Drive, and Mainway at Sutton Drive, caused by the build-out of the development. This is reflected based on the assessment of the intersections projected to operate over capacity due to site generated traffic.

Based on the road classification and network connectivity, most site traffic is expected to use Upper Middle Road, Burloak Drive, and Mainway to access the site.

It is not expected that Sutton Drive (north of Upper Middle Road) or the potential Corporate Drive connection will used significantly by development traffic due to the distance, stop-controlled intersections, and local road designs.

Transportation Demand Management

A key TDM strategy will be the provision of public transit to this area. The use of transit places less reliance on personal automobiles for trips that can be completed with convenient and desirable transit options. The subject site is currently served by four Burlington Transit routes that operate primarily on Upper Middle Road, Mainway, and Appleby Line and provide connections to Appleby GO, Burlington GO, and GO Bus 407 Carpool Stations; however, additional routes and capacity should be provided to serve the future community.

The development lands also lend themselves to TDM benefits associated with mixed or multi-use development. This form of development supports sustainability initiatives by promoting complementary land uses in close proximity.

The future traffic operations with the development cannot be fully mitigated by auto infrastructure improvements alone. This is recognized in the City of Burlington’s Official Plan, which identifies an integrated and multi-modal transportation system that will be achieved by prioritizing decision-making to shift more trips away from the private car and to more sustainable transportation options, such as walking, biking, transit and car sharing.

Future plans include High Occupancy Vehicle (HOV)/Bus Lanes along Upper Middle Road and Burloak Drive. The provision of high-density mixed-use developments in the proposed development is essential to achieving the goals of the City.

As individual development blocks are build-out, TDM measures will be included in the site plan design and reviewed through the SPA process.

11.2 Recommendations

Based on the findings of this study, it is recommended that:

- The road authority plan for the future implementation of the remedial measures summarized in **Table 11.1**. **Figure 7.12** illustrates the proposed remedial measures.
- The Applicant will work with the road authorities to determine appropriate cost sharing contributions for the planned roadway improvements outlined in **Table 11.1**.
- The City should plan to meet its mode share targets by continuing to promote TDM measures and supporting shifts to alternative modes of travel to reduce single-occupant vehicle trips
- Burlington Transit consider adding new transit routes and infrastructure to serve the proposed development.

TABLE 11.1: PROPOSED MITIGATION MEASURES

Intersection	Improvement	Horizon Year	Applicant Responsibility
Appleby Line & Dundas Street	Signal timing adjustments	2035 Background	No

Hi everyone,

I hope this email finds you well.

Attached, please find the minutes from our meeting held on Wednesday, July 31st. The document includes a summary of the key points discussed, decisions made, and action items assigned.

Please review the attached minutes and let me know if you have any questions or require further clarification.

Happy long weekend.

Best regards,

Derek Napoli, C.E.T.

Good afternoon Greg,

We're happy to discuss the scope of the study area. I'll organize a discussion meeting within the next few weeks. Our schedules are almost full next week but we could potentially meet between 2:00 and 3PM Wednesday, July 31st. Otherwise, we can organize a meeting early August.

Enjoy your weekend!

Hi Derek,
Thanks for providing those comments on the TOR. We have reviewed the comments provided by the City and wanted to discuss the expanded study area.

1. We do not feel that additional analysis along Appleby Line is warranted. Specifically, our preliminary site traffic forecasts estimate less than 250 vehicles per direction during the peak hours north of Upper Middle Road or south of Mainway. Based on the location, the primary access to the QEW will Burloak Drive. Site traffic along Appleby Line through the majority of the additional intersections listed will be north/south through traffic. I'm not sure what benefit the analysis will provide as it is unlikely further geometric and/or traffic control upgrades beyond the planned six-lane widening could be required.
2. The intersection of Old Burloak Drive & Burloak Drive (unsignalized) does not generate a significant volume. We will omit this intersection from the assessment; however we will discuss the implications of queue lengths from the upstream and downstream intersections.

Based on the above, we respectfully request you review the following and reconsider the need for an expanded study area.

Thanks,

Greg Lue, M.A.Sc., P.Eng.

   - Eight internal intersections

2. Existing Data
    - Traffic counts from 2023 are acceptable but 2024 traffic counts are preferred. The collection of any new TMC data must wait until at least mid September.

3. Horizon Years
    - 2024 Base Year
    - 2040 Horizon Year (Full Build-out)

4. Analysis Periods
    - Weekday AM peak hour
    - Weekday PM peak hour

5. Analysis
    - Synchro 11
    - HCM 2000
    - SimTraffic Queueing (five 60-min iterations)

6. Background Traffic
    - Generalized growth rate 1% per annum for all City of Burlington roadways except along Fairview Street use 2% (a 2% percent growth rate accounts for the planned developments at Fairview St and Appleby Ln that are in early pre-con planning stages)
    - Background developments
        - 2273 Turnberry Road
        - Latch Development - 1989 Appleby Line
        - 5030-5045 Tico Creek Common
        - Millcroft Greens – 2155 Country Club Drive
        - 5219 Upper Middle Road
        - 1860-1900 Appleby Line

7. Site Traffic Estimates
    - ITE Trip Generation Data 11th Edition
    - No modal split reductions

8. Site Traffic Distribution
    - Existing travel patterns/TTS data

9. TDM Plan
    - Will outline existing and proposed TDM measures and assess their likely effectiveness for the proposed development.

10. Report
    - We will document the study methodologies, findings, and conclusions in a report with appendices containing the detailed analysis results and any data collected.
    - Mainway Multi-modal Level of Service (MMLOS) Study from Burloak Drive to Appleby Line.

11. Future Considerations
    - Future amendments, including MMLOS, will be required when the locations of future roads have been finalized.

Subject: RE: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference

Hi Greg,

Aside from our previously stated T of R comments by Halton Region, I have the following additional comments on your below items.

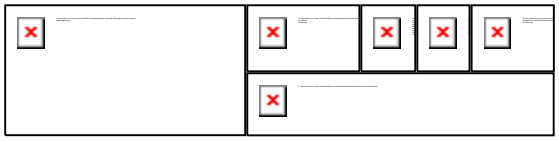
Growth Rates:

-since the application is for Local Official Plan Amendment, Zoning By-Law Amendment and Draft Plan of Subdivision, the 4% does not fully include the proposed residential development traffic generation & distribution
-the 4% along Burloak and Upper Middle Road, specifically for this area, is directly from Halton's EMME model and should not be adjusted/altered
-while not specifically from the model, the 4% will also account for local traffic using these roadways as opposed to staying on the at-capacity QEW westbound through the City, thus supporting the higher growth rate
-for the TIS Report recommendations, please clearly outline which area intersection mitigation measures are attributed to the development site traffic, and those attributed to background and total traffic volumes.

Intersection Plan:

The intersection plan included in the email does not match the one Halton Transportation Development Review staff commented on previously. Regardless, on our **attached** intersection plan we have labelled black dots the intersection

locations Halton would support as acceptable, based on surrounding existing conditions. Halton's intersection plan was previously included with our last comments as well. Please use this plan when making revisions to your draft plan and intersection locations, as part of the transportation impact study.



All other locations shown (right-in/right-out) will not be reviewed/supported until the submission of a transportation impact study. All intersections (full movement signalized) and accesses proposed (right-in/right-out) must be fully detailed and justified in the transportation impact study.

Lastly, any City of Burlington comments on the T of R, which I understand are forthcoming, will be supported by Halton Region.

Thanks,

Matt

Subject: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Hi all,
Thanks for providing comments on the Bronte Creek Meadows Terms of Reference. **City of Burlington**, please let me know if you have any additional comments.

With regards to the growth rate, the Region stated:

> *Halton's most up to date and acceptable growth rates (confirmed by Halton's Infrastructure Planning Policy group in April 2024) to use for this Study are as follows:*
> - *Burloak Drive north of Mainway: 4% to 2031 and then 1% from 2031 to 2041*
> - *Upper Middle Road west of Burloak Drive: 4% to 2031 and then 1% from 2031 to 2041*
> - *Appleby Line at Upper Middle Road: 2% to 2031 and then 1% from 2031 to 2041"*

The 4% per annum along Burloak and Upper Middle seems very high for this area which appears to be mostly developed except for the proposed site. Does the 4% include the proposed Bronte Creek Meadows development? I did a rough check of the Region's growth rate and it puts volumes into a similar range as applying 1% per annum growth rate plus the proposed development traffic so I worry that applying the 4% growth rate to this study would be double counting/overestimating traffic growth in the area.
Looking at the City of Burlington's development applications in the area, I've noted a few surrounding developments (attached) which will be included as background developments in the analysis. Would

the Region/City accept a 1% per annum growth rate on the roadways in addition to the five noted background developments traffic?

Please see below for an updated Terms of Reference:

Paradigm Transportations Solutions Limited has been retained to conduct a Transportation Impact Analysis for a proposed development located southeast of Upper Middle Road and Burloak Drive (Bronte Creek Meadows) in the City of Burlington. The property owner is proposing to develop the lands with a mixed-use subdivision including employment, institutional, retail, and variety of low, medium, and high-density residential uses in addition to park and open space. Vehicle access is proposed via connections to Upper Middle Road, Burloak Drive, and Mainway. A preliminary site concept is attached.

Based on the size of the development, a horizon year of 2040 is proposed to capture the full-build out of the development and the long-term transportation impacts and improvements that may be required to accommodate future traffic growth.

<u>Proposed Terms of Reference</u>

Study Area Intersections

- Appleby Line & Upper Middle Road (signalized)
- Corpus Christi Catholic Secondary School West Driveway & Upper Middle Road (signalized)
- Corpus Christi Catholic Secondary School East Driveway & Upper Middle Road (signalized)
- Quinte Street & Upper Middle Road (unsignalized)
- Sutton Drive & Upper Middle Road (signalized)
- Baker Drive & Upper Middle Road (unsignalized)
- Deer Place & Upper Middle Road (unsignalized)
- Blue Spruce Avenue & Upper Middle Road (unsignalized)
- Bronte Creek Provincial Park Access & Burloak Drive (unsignalized)
- Appleby Line & Corporate Drive (signalized)
- Appleby Line & Mainway (signalized)
- Lampman Avenue/Norjohn Court & Mainway (unsignalized)
- Sutton Drive & Mainway (unsignalized)
- Burloak Drive & Mainway (signalized)
- Burloak Drive & North Service Road (signalized)
- Burloak Drive & QEW WB Off-Ramp (signalized)
- Burloak Drive & QEW EB Off-Ramp (signalized)
- Eight internal intersections

Existing Data

- Weekday AM and PM counts collected on Sept 28, 2023
- Does the City/Region have any concerns with new Saturday traffic data being collected in the coming weeks?

Horizon Years

- 2024 Base Year
- 2040 Horizon Year

Analysis Periods

- Weekday AM peak hour
- Weekday PM peak hour
- Saturday peak hour

Analysis

- Synchro 11
- HCM 2000

- SimTraffic Queueing (five 60-min iterations)

Background Traffic

- Generalized growth rate 1% per annum
- Traffic generated by any in stream developments in the area. **City of Burlington**– can you comment on this and provide any relevant studies or inputs to estimate the traffic for the site(s)?

Future Network

- Widening of Burloak, Upper Middle Road, and Appleby from 4 to 6 lanes with the curb lanes converted to high occupancy vehicle (HOV) or bus rapid transit (BRT) lanes after completion of the road widening
- Widening to be assumed to be completed by 2032 and will be included in the future background and future total (with development) scenarios

Site Traffic Estimates

- ITE Trip Generation Data 11th Edition
- No modal split reductions

Site Traffic Distribution.

- Existing travel patterns/TTS data

Access Management

- Access management and spacing will be discussed
- Region proposed access locations will be considered. If different locations are proposed, justification will be provided for why they should be permitted.

TDM Plan

- Will outline existing and proposed TDM measures and assess their likely effectiveness for the proposed development

Report

- We will document the study methodologies, findings, and conclusions in a report with appendices containing the detailed analysis results and any data collected.

Thanks !

Subject: FW: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference

Hi Greg,

Re: Traffic Impact Study Terms of Reference
Land Development Planning - **Bronte Creek Meadows**
5164 - 5900 Upper Middle Road and 5201 Mainway, Burlington, ON. (**QEW**)
MTO Pre-consultation No.: **2024-20T-000515**

After review of the TIS Terms of Reference for the above-described proposed development, and in accordance with the PTHIA, the MTO Traffic Office offers the following comments and highlighted in your ToR below in **red**:

- The TIS must be completed by a RAQS qualified consultant. Any data collected for the TIS must be by a RAQS qualified company/consultant.
- Study must include QEW/Appleby ramps in the analysis as well.
- Growth rate for QEW/Burloak is 3.5%, QEW/Appleby is 3.3%.

Please do not hesitate to contact me if you have any questions.

Thanks,

Paul Nunes

To: Nunes, Paul (MTO) <Paul.Nunes@ontario.ca>
Subject: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference

CAUTION -- EXTERNAL E-MAIL - Do not click links or open attachments unless you recognize the sender.

Hi Paul,
Back in April you provided the following comments on the Traffic Impact Study TOR for the Bronte Creek Meadows development located northwest Burloak Drive at Mainway in the City of Burlington:

> *Please note that if the site is to be designated / zoned as Mixed Use then it will be classified as a major traffic generator, and will be*
> *subject to MTO's 800 m permit control provisions, as per Sec 38(2)(f) of the PTHIA.*

We recommend that the Traffic Impact Study (TIS) be completed in accordance with MTO's 2023 TIS Guidelines, and that the municipality act as the proponent. A development proposal of this magnitude will most likely be phased over a number of years, with periodic TIS updates required to confirm if / when improvements to the QEW / Burloak Drive interchange may be required. MTO's preference is to have the municipality coordinate and present to MTO a plan for highway interchange improvements, if / when required, and make appropriate arrangements to recover costs for and ultimately design and construct any required highway improvements.

Based on your comments we will expand out horizon years to follow the MTO guidelines and include full build-out, 5 year, and 10 year horizons. At this stage of the application detailed phasing of the development is not set. As such, we're proposing to analysis the full build-out year plus 5/10 year horizons.

We expect the majority of the traffic to use Burloak Drive/QEW interchange as that is the closest and most direct interchange for the subject site. We've recently had a discussion with the City of Burlington and Halton Region regarding their comments on the study and wanted to confirm with the MTO that the changes to the TOR and study area are acceptable. Based on your comments and discussion with the City of Burlington and Halton Region we've expanded the study to include the following highlighted changes

1. Study Area Intersections
   - Appleby Line & Fairview Street (signalized)
   - Appleby Line & Harvester Road (signalized)
   - Appleby Line & North Service Road (signalized)
   - Appleby Line & Mainway (signalized)
   - Appleby Line & Corporate Drive (signalized)
   - Appleby Line & Upper Middle Road (signalized)
   - Appleby Line & Dundas Street (signalized)
   - Appleby Line & QEW WB Off-Ramp (signalized)
   - Appleby Line & QEW EB Off-Ramp (signalized)
   - Corpus Christi Catholic Secondary School West Driveway & Upper Middle Road (signalized)
   - Corpus Christi Catholic Secondary School East Driveway & Upper Middle Road (signalized)
   - Quinte Street & Upper Middle Road (unsignalized)
   - Sutton Drive & Upper Middle Road (signalized)
   - Baker Drive & Upper Middle Road (unsignalized)
   - Deer Place & Upper Middle Road (unsignalized)
   - Blue Spruce Avenue & Upper Middle Road (unsignalized)
   - Bronte Creek Provincial Park Access & Burloak Drive (unsignalized)
   - Lampman Avenue/Norjohn Court & Mainway (unsignalized)
   - Sutton Drive & Mainway (unsignalized)
   - Burloak Drive & Mainway (signalized)
   - Burloak Drive & North Service Road (signalized)
   - Burloak Drive & QEW WB Off-Ramp (signalized)
   - Burloak Drive & QEW EB Off-Ramp (signalized)

2. Analysis Period: Weekday AM peak hour, Weekday PM peak hour, Saturday peak hour
3. Horizon Years: 2035 (Opening), 2040 (+5 years), 2045 (+10 years)

4. Analysis
   - Synchro 11 – we will accept version 11 until Dec 2024, then only accept version 12
   - HCM 2000
   - SimTraffic Queueing (five 60-min iterations)

5. Background Traffic
   - Generalized growth rate 1% per annum for all City of Burlington roadways except along Fairview Street use 2% (a 2% percent growth rate accounts for the planned developments at Fairview St and Appleby Ln that are in early pre-con planning stages)
   - Burloak Drive north of Mainway: 4% to 2031 and then 1% from 2031 to 2045
   - Upper Middle Road west of Burloak Drive: 4% to 2031 and then 1% from 2031 to 2045
   - Appleby Line at Upper Middle Road: 2% to 2031 and then 1% from 2031 to 2045
   - Growth rate for QEW/Burloak is 3.5%, QEW/Appleby is 3.3%

   - Background developments
     - 2273 Turnberry Road
     - Latch Development - 1989 Appleby Line
     - 5030-5045 Tico Creek Common
     - Millcroft Greens – 2155 Country Club Drive
     - 5219 Upper Middle Road
     - 1860-1900 Appleby Line

6. Site Traffic Estimates
   - ITE Trip Generation Data 11th Edition
   - No modal split reductions

7. Site Traffic Distribution
   - Existing travel patterns/TTS data

8. Sight line analysis for access intersections

9. TDM Plan
   - Will outline existing and proposed TDM measures and assess their likely effectiveness for the proposed development.

10. Future transit routing

11. Multi-modal Level of Service (MMLOS) Study for Mainway from Burloak Drive to Appleby Line.

12. Report
   - We will document the study methodologies, findings, and conclusions in a report with appendices containing the detailed analysis results and any data collected.
   - The need for geometric improvements shall be reviewed at all locations in the study area and for each proposed development stage. The TIS shall clearly identify transportation impacts by movement, the transportation system improvements that are needed to mitigate these impacts, and the timing of any recommended improvements. A schematic representation of all geometric improvements shall be included as part of the TIS, identifying lane arrangements and intersection improvements for each horizon year.

Please let me know if you have any comments on the updated TOR.

Thanks,

Subject: RE: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference
Attachments: Intersection Mark Up Plan April 2024.pdf

Hi Greg,

Aside from our previously stated T of R comments by Halton Region, I have the following additional comments on your below items.

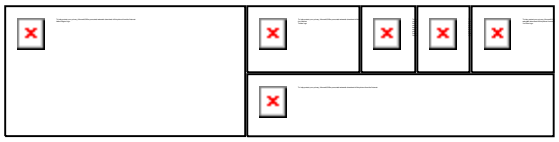
Growth Rates:

-since the application is for Local Official Plan Amendment, Zoning By-Law Amendment and Draft Plan of Subdivision, the 4% does not fully include the proposed residential development traffic generation & distribution
-the 4% along Burloak and Upper Middle Road, specifically for this area, is directly from Halton's EMME model and should not be adjusted/altered
-while not specifically from the model, the 4% will also account for local traffic using these roadways as opposed to staying on the at-capacity QEW westbound through the City, thus supporting the higher growth rate
-for the TIS Report recommendations, please clearly outline which area intersection mitigation measures are attributed to the development site traffic, and those attributed to background and total traffic volumes.

Intersection Plan:

The intersection plan included in the email does not match the one Halton Transportation Development Review staff commented on previously. Regardless, on our **attached** intersection plan we have labelled black dots the intersection locations Halton would support as acceptable, based on surrounding existing conditions. Halton's intersection plan was previously included with our last comments as well. Please use this plan when making revisions to your draft plan and intersection locations, as part of the transportation impact study.

All other locations shown (right-in/right-out) will not be reviewed/supported until the submission of a transportation impact study. All intersections (full movement signalized) and accesses proposed (right-in/right-out) must be fully detailed and justified in the transportation impact study.



Lastly, any City of Burlington comments on the T of R, which I understand are forthcoming, will be supported by Halton Region.

Thanks,

Matt

Subject: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Hi all,
Thanks for providing comments on the Bronte Creek Meadows Terms of Reference. **City of Burlington**, please let me know if you have any additional comments.

With regards to the growth rate, the Region stated:

> *Halton's most up to date and acceptable growth rates (confirmed by Halton's Infrastructure Planning Policy group in April 2024) to use for this Study are as follows:*
> - *Burloak Drive north of Mainway: 4% to 2031 and then 1% from 2031 to 2041*
> - *Upper Middle Road west of Burloak Drive: 4% to 2031 and then 1% from 2031 to 2041*
> - *Appleby Line at Upper Middle Road: 2% to 2031 and then 1% from 2031 to 2041"*

The 4% per annum along Burloak and Upper Middle seems very high for this area which appears to be mostly developed except for the proposed site. Does the 4% include the proposed Bronte Creek Meadows development? I did a rough check of the Region's growth rate and it puts volumes into a similar range as applying 1% per annum growth rate plus the proposed development traffic so I worry that applying the 4% growth rate to this study would be double counting/overestimating traffic growth in the area.
Looking at the City of Burlington's development applications in the area, I've noted a few surrounding developments (attached) which will be included as background developments in the analysis. Would the Region/City accept a 1% per annum growth rate on the roadways in addition to the five noted background developments traffic?

Please see below for an updated Terms of Reference:

Paradigm Transportations Solutions Limited has been retained to conduct a Transportation Impact Analysis for a proposed development located southeast of Upper Middle Road and Burloak Drive (Bronte Creek Meadows) in the City of Burlington. The property owner is proposing to develop the lands with a mixed-use subdivision including employment, institutional, retail, and variety of low, medium, and high-density residential uses in addition to park and open space. Vehicle access is proposed via connections to Upper Middle Road, Burloak Drive, and Mainway. A preliminary site concept is attached.

Based on the size of the development, a horizon year of 2040 is proposed to capture the full-build out of the development and the long-term transportation impacts and improvements that may be required to accommodate future traffic growth.

Proposed Terms of Reference

Study Area Intersections

- Appleby Line & Upper Middle Road (signalized)
- Corpus Christi Catholic Secondary School West Driveway & Upper Middle Road (signalized)
- Corpus Christi Catholic Secondary School East Driveway & Upper Middle Road (signalized)
- Quinte Street & Upper Middle Road (unsignalized)
- Sutton Drive & Upper Middle Road (signalized)
- Baker Drive & Upper Middle Road (unsignalized)
- Deer Place & Upper Middle Road (unsignalized)
- Blue Spruce Avenue & Upper Middle Road (unsignalized)
- Bronte Creek Provincial Park Access & Burloak Drive (unsignalized)
- Appleby Line & Corporate Drive (signalized)
- Appleby Line & Mainway (signalized)
- Lampman Avenue/Norjohn Court & Mainway (unsignalized)
- Sutton Drive & Mainway (unsignalized)
- Burloak Drive & Mainway (signalized)
- Burloak Drive & North Service Road (signalized)
- Burloak Drive & QEW WB Off-Ramp (signalized)
- Burloak Drive & QEW EB Off-Ramp (signalized)
- Eight internal intersections

Existing Data

- Weekday AM and PM counts collected on Sept 28, 2023
- Does the City/Region have any concerns with new Saturday traffic data being collected in the coming weeks?

Horizon Years

- 2024 Base Year
- 2040 Horizon Year

Analysis Periods

- Weekday AM peak hour
- Weekday PM peak hour
- Saturday peak hour

Analysis

- Synchro 11
- HCM 2000
- SimTraffic Queueing (five 60-min iterations)

Background Traffic

- Generalized growth rate 1% per annum
- Traffic generated by any in stream developments in the area. **City of Burlington**– can you comment on this and provide any relevant studies or inputs to estimate the traffic for the site(s)?

Future Network

- Widening of Burloak, Upper Middle Road, and Appleby from 4 to 6 lanes with the curb lanes converted to high occupancy vehicle (HOV) or bus rapid transit (BRT) lanes after completion of the road widening
- Widening to be assumed to be completed by 2032 and will be included in the future background and future total (with development) scenarios

Site Traffic Estimates

- ITE Trip Generation Data 11th Edition
- No modal split reductions

Site Traffic Distribution.

- Existing travel patterns/TTS data

Access Management

- Access management and spacing will be discussed

- Region proposed access locations will be considered. If different locations are proposed, justification will be provided for why they should be permitted.

TDM Plan

- Will outline existing and proposed TDM measures and assess their likely effectiveness for the proposed development

Report

- We will document the study methodologies, findings, and conclusions in a report with appendices containing the detailed analysis results and any data collected.

Thanks !

Greg Lue, M.A.Sc., P.Eng.
Project Manager, Associate

Hi Paul,
Thanks for the comments. I just gave you a call about Saturday traffic counts. I wanted to ask if the MTO requires the Saturday analysis or not. The Region had requested the Saturday analysis because the proposed subdivision development has retail land uses. We collected a number of counts on Saturday July 13, 2024. The City then provided comment that they would not accept counts collected in the summer with one of the reasons being the absence of school traffic and possible variations in commuter traffic. However, given these are Saturday counts, this should not be as much of an issue. We proposed applying a conservative +15% summer adjustment factor for the July counts based fall/summer data we have in the corridor and MTO AADT data on the QEW but the City still wants us to recount the Saturday. Attached is our unprocessed TMC data for the weekday AM/PM and Saturday peak hours and correspondence with the City for reference.

I would like to ask MTO if you require Saturday analysis for the highway ramps. Based on our data, the highest volumes occur during the weekday AM and PM peak hours and our trip generation forecasts are highest for the weekday AM and PM peak hours. If we are to recount the Saturday

TMCs collected in July as requested by the City (which includes the QEW/Burloak ramps), would the MTO require us to count the QEW/Burloak ramps or would it be acceptable for us to omit the QEW ramps from the Saturday analysis as they do not experience the critical peak hour volumes?

Please let me know or feel free to give me a call to discuss.

Thanks,

Hi Greg,

Re: Traffic Impact Study Terms of Reference
Land Development Planning - **Bronte Creek Meadows**
5164 - 5900 Upper Middle Road and 5201 Mainway, Burlington, ON. (**QEW**)
MTO Pre-consultation No.: **2024-20T-000515**

After review of the TIS Terms of Reference for the above-described proposed development, and in accordance with the PTHIA, the MTO Traffic Office offers the following comments and highlighted in your ToR below in **red**:

- The TIS must be completed by a RAQS qualified consultant. Any data collected for the TIS must be by a RAQS qualified company/consultant.
- Study must include QEW/Appleby ramps in the analysis as well.
- Growth rate for QEW/Burloak is 3.5%, QEW/Appleby is 3.3%.

Please do not hesitate to contact me if you have any questions.

Thanks,

Subject: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference

CAUTION -- EXTERNAL E-MAIL - Do not click links or open attachments unless you recognize the sender.

Hi Paul,
Back in April you provided the following comments on the Traffic Impact Study TOR for the Bronte Creek Meadows development located northwest Burloak Drive at Mainway in the City of Burlington:

> *Please note that if the site is to be designated / zoned as Mixed Use then it will be classified as a major traffic generator, and will be subject to MTO's 800 m permit control provisions, as per Sec 38(2)(f) of the PTHIA. We recommend that the Traffic Impact Study (TIS) be completed in accordance with MTO's 2023 TIS Guidelines, and that the municipality act as the proponent. A development proposal of this magnitude will most likely be phased over a number of years, with periodic TIS updates required to confirm if / when improvements to the QEW / Burloak Drive interchange may be required. MTO's preference is to have the municipality coordinate and present to MTO a plan for highway interchange improvements, if / when required, and make appropriate arrangements to recover costs for and ultimately design and construct any required highway improvements.*

Based on your comments we will expand out horizon years to follow the MTO guidelines and include full build-out, 5 year, and 10 year horizons. At this stage of the application detailed phasing of the development is not set. As such, we're proposing to analysis the full build-out year plus 5/10 year horizons.

We expect the majority of the traffic to use Burloak Drive/QEW interchange as that is the closest and most direct interchange for the subject site. We've recently had a discussion with the City of Burlington and Halton Region regarding their comments on the study and wanted to confirm with the MTO that the changes to the TOR and study area are acceptable. Based on your comments and discussion with the City of Burlington and Halton Region we've expanded the study to include the following highlighted changes

1. Study Area Intersections
   - Appleby Line & Fairview Street (signalized)
   - Appleby Line & Harvester Road (signalized)
   - Appleby Line & North Service Road (signalized)
   - Appleby Line & Mainway (signalized)
   - Appleby Line & Corporate Drive (signalized)
   - Appleby Line & Upper Middle Road (signalized)
   - Appleby Line & Dundas Street (signalized)

- Appleby Line & QEW WB Off-Ramp (signalized)
- Appleby Line & QEW EB Off-Ramp (signalized)
- Corpus Christi Catholic Secondary School West Driveway & Upper Middle Road (signalized)
- Corpus Christi Catholic Secondary School East Driveway & Upper Middle Road (signalized)
- Quinte Street & Upper Middle Road (unsignalized)
- Sutton Drive & Upper Middle Road (signalized)
- Baker Drive & Upper Middle Road (unsignalized)
- Deer Place & Upper Middle Road (unsignalized)
- Blue Spruce Avenue & Upper Middle Road (unsignalized)
- Bronte Creek Provincial Park Access & Burloak Drive (unsignalized)
- Lampman Avenue/Norjohn Court & Mainway (unsignalized)
- Sutton Drive & Mainway (unsignalized)
- Burloak Drive & Mainway (signalized)
- Burloak Drive & North Service Road (signalized)
- Burloak Drive & QEW WB Off-Ramp (signalized)
- Burloak Drive & QEW EB Off-Ramp (signalized)

2. Analysis Period: Weekday AM peak hour, Weekday PM peak hour, Saturday peak hour
3. Horizon Years: 2035 (Opening), 2040 (+5 years), 2045 (+10 years)

4. Analysis
   - Synchro 11 – we will accept version 11 until Dec 2024, then only accept version 12
   - HCM 2000
   - SimTraffic Queueing (five 60-min iterations)

5. Background Traffic
   - Generalized growth rate 1% per annum for all City of Burlington roadways except along Fairview Street use 2% (a 2% percent growth rate accounts for the planned developments at Fairview St and Appleby Ln that are in early pre-con planning stages)
   - Burloak Drive north of Mainway: 4% to 2031 and then 1% from 2031 to 2045
   - Upper Middle Road west of Burloak Drive: 4% to 2031 and then 1% from 2031 to 2045
   - Appleby Line at Upper Middle Road: 2% to 2031 and then 1% from 2031 to 2045
   - Growth rate for QEW/Burloak is 3.5%, QEW/Appleby is 3.3%

   - Background developments
     - 2273 Turnberry Road
     - Latch Development - 1989 Appleby Line
     - 5030-5045 Tico Creek Common
     - Millcroft Greens – 2155 Country Club Drive
     - 5219 Upper Middle Road
     - 1860-1900 Appleby Line

6. Site Traffic Estimates
   - ITE Trip Generation Data 11th Edition
   - No modal split reductions

7. Site Traffic Distribution
   - Existing travel patterns/TTS data

8. Sight line analysis for access intersections

9. TDM Plan
   - Will outline existing and proposed TDM measures and assess their likely effectiveness for the proposed development.

10. Future transit routing

11. Multi-modal Level of Service (MMLOS) Study for Mainway from Burloak Drive to Appleby Line.

12. Report
   - We will document the study methodologies, findings, and conclusions in a report with appendices containing the detailed analysis results and any data collected.
   - The need for geometric improvements shall be reviewed at all locations in the study area and for each proposed development stage. The TIS shall clearly identify transportation impacts by movement, the transportation system improvements that are needed to mitigate these impacts, and the timing of any recommended improvements. A schematic representation of all geometric improvements shall be included as part of the TIS, identifying lane arrangements and intersection improvements for each horizon year.

Please let me know if you have any comments on the updated TOR.

Thanks,

Greg Lue, M.A.Sc., P.Eng.

Sent: November 20, 2024 4:15 PM
To: Greg Lue
Cc: Scattolon, Walter; Lucas, Sandra; Krusto, Matt
Subject: RE: (230553) Bronte Creek Meadows - TIS Terms of Reference - Trip Distribution and Summer Factor

Follow Up Flag: Follow up
Flag Status: Flagged

Hi Greg,

After discussions between the City and Region, we have the following comments with respect to the traffic distribution for the TIS:

- An additional Corporate Drive Extension scenario must be added to outline volume redistribution relief,
    - Noting that the Corporate Drive Extension also provides access to Mainway via Sutton Drive.

- High volumes of inbound site traffic originating from Appleby Line and Mainway intersection, are noted entering the site (NBL), during the PM and Saturday peak hours at the Burloak Drive and Corporate Drive intersection. Allocate a higher proportion of the inbound site traffic to Sutton Drive and Mainway (EBL) to avoid long queues and multiple left-turns along Burloak Drive.

- Where left-turn volumes at intersections that approach or exceed 400 vehicles per hour, review the requirement for dual left-turn lanes (i.e., northbound Burloak Drive at Corporate Drive, Burloak Drive at Mainway (NB, EB), Upper Middle Road at Appleby Line (WB conversion of hatched area)).
    - This will require, as part of the TIS, a functional plan showing Burloak Drive at 6 lanes with a northbound dual left-turn lane at Corporate Drive and Mainway intersection.
    - Burloak Drive is shown the Region's Capital Budget for start of construction in 2029 for the widening from 4 to 6 lanes (Harvester Rd to Upper Middle Rd).

- The Upper Middle Road at Appleby Line intersection must be closely reviewed, and recommendations provided for improvements based on site volumes. For example, recommendations including but not limited to: dual westbound left-turn lanes (convert hatched area), extending existing westbound right-turn channelized lane.

- The spacing of the Corporate Drive intersection at Burloak Drive, as previously noted, is not acceptable. While spacing is not shown on the plan, it appears to remain in the same location as previous plans. Detailed intersection spacing is required as part of the TIS to confirm intersection spacing is acceptable and will require internal plan changes should the intersection spacing be found unacceptable.

- The Upper Middle Road intersections have now changed, with an intersection connection shown at Blue Spruce instead of Deer Place. The Upper Middle Road development intersection connections are now show at Quinte, Sutton and Blue Spruce (previously it was shown at Quinte, Sutton and Deer Place). For the Upper Middle Road at Blue Spruce intersection, a safety and sight-line analysis will be required due to the horizontal curve along Upper Middle Road/Burloak Drive immediately to the southeast, and the proposed development buildings along this curved section of Burloak Drive close to property line.

- Inform the MTO where high site volumes are noted at the QEW ramps (300-400 vehicles).

Confirmation for the removal of the noted intersections from the Saturday counts/analysis:

- Corpus Christi Catholic Secondary School West Driveway & Upper Middle Road (signalized)
- Corpus Christi Catholic Secondary School East Driveway & Upper Middle Road (signalized)
- Baker Drive & Upper Middle Road (unsignalized)
- Deer Place & Upper Middle Road (unsignalized)
- Lampman Avenue/Norjohn Court & Mainway (unsignalized)

Please let me know if you have any questions or require any clarification.

Subject: RE: (230553) Bronte Creek Meadows - TIS Terms of Reference - Trip Distribution and Summer Factor

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Hi Derek,
Just gave you a call to discuss the summer factor and recounting the July intersections.

I understand the request for a Saturday peak hour analysis as the development includes retail developments. Reviewing the weekday commuter traffic patterns and the collected TMC data, Saturday does not appear to have the critical volumes as observed during the weekday peak hours. In addition, our trip generation forecasts estimate Saturday peak hour to be the lowest generator of the peak hours.

In an effort to provide a Saturday analysis that fulfills the City/Region's requirements but also streamlines the number of recounted/analyzed intersections, would the City/Region be open to accepting a Saturday analysis that focusses on the higher volume intersections in the study area and omits the lower volume side streets? Below is a list of the intersections collected in July that would

need to be recounted. I've marked some in red which are low volume and could possibly be omitted from the recount/Saturday analysis

- Appleby Line & Mainway (signalized)
- Appleby Line & Corporate Drive (signalized)
- Appleby Line & Upper Middle Road (signalized)
- Corpus Christi Catholic Secondary School West Driveway & Upper Middle Road (signalized) – no school traffic on Saturday
- Corpus Christi Catholic Secondary School East Driveway & Upper Middle Road (signalized) – no school traffic on Saturday
- Quinte Street & Upper Middle Road (unsignalized)
- Sutton Drive & Upper Middle Road (signalized)
- Baker Drive & Upper Middle Road (unsignalized) – relatively low volume on saturday
- Deer Place & Upper Middle Road (unsignalized) – relatively low volume on saturday
- Blue Spruce Avenue & Upper Middle Road (unsignalized)
- Bronte Creek Provincial Park Access & Burloak Drive (unsignalized)
- Lampman Avenue/Norjohn Court & Mainway (unsignalized) – relatively low volume on saturday
- Sutton Drive & Mainway (unsignalized)
- Burloak Drive & Mainway (signalized)
- Burloak Drive & North Service Road (signalized)
- Burloak Drive & QEW WB Off-Ramp (signalized)
- Burloak Drive & QEW EB Off-Ramp (signalized)

I've reached out to MTO about possibly omitting the QEW ramps from Saturday analysis and reached out to the Region for their general thoughts on the July counts. I've also cc'd the Region to keep them in the loop on this email.

Let me know if this sounds acceptable to the City. Please let me know if you want to have a call or set up a meeting to discuss. As the number of available weeks to count before the holiday quickly dwindles, I hope we can sort this out soon.

Thanks !

Subject: RE: (230553) Bronte Creek Meadows - TIS Terms of Reference - Trip Distribution and Summer Factor

Hi Greg,

I haven't yet been able to meet with the Region to discuss the Trip Distribution but I can provide our comments with regard to the use of the summer traffic counts and the seasonal adjustment factor. In addition to our concerns with using counts taken during summer, Transportation Planning were concerned with counts taken after the flooding that occurred in July. The counts were in fact take a few days before the flooding occurred on July 15th to 16th.

While the turning movement counts were not collected after the summer flood and understanding the rational you put forward, I must still advise that we cannot support utilizing the summer turning movement counts with a seasonal adjustment factor. The proposed seasonal adjustment factor assumption is based on a small sample size that is unlikely to hold up to scrutiny at a hearing. Additionally, the MTO's seasonal variation data is not representative of the Bronte Creek Meadows area road network. My recommendation is to use turning movement counts collected following the standard practices previously outlined below on October 4th and the Terms of Reference.

I will provide comments regarding the proposed Trip Distribution soon after I'm able to meet with the Region. Please let me know if you have any questions.

Best Regards,

Derek Napoli, C.E.T.

Good morning Greg,

Apologies for not providing an update last week. I'm meeting with the Region this week to discuss the trip distribution and summer factor to ensure we are all on the same page.

Can you please provide the date of the Saturday count that was completed in July?

Thank you and I hope you enjoy the warm weather.

Regards,

Derek Napoli, C.E.T.

Hi Derek,
Thanks for the update on the status of the Trip Distribution and Assignment letter.

As for the seasonal adjustment factor, I completely understand the need for counts to be collected during typical weekdays and during the school year given the proximity to the school in the study area. Weekday counts were collected during the school year in October 2023. The portion of counts collected in July are for the Saturday peak hour.

While not as ideal as counts during the school year, Saturday counts should have limited impact from trips from the nearby school and are applicable for a summer adjustment factor to be applied. Our proposed summer adjustment factor based on a comparison of July 2024 and September 2024 count data provides a sufficient conservative estimation (err on high side) for Saturday peak hour volumes throughout the study area and we request the City reconsider their requirement to recollect the portion of Saturday counts collected in July.

From our previous discussions, a Saturday peak hour was required to assess the impact from the proposed retail portion of the development. In a review of the Saturday traffic counts we see the peak directional Saturday volumes do not exceed the weekday AM and PM peak hour directional volumes (see attached excel). Trip generation during the Saturday peak hour is forecasted to be less than the weekday AM and PM peak hours. Considering these factors, we estimate that the Saturday peak hour, even with a +15%summer adjustment factor applied, will not be the critical volumes impacting movements.

We acknowledge the importance of analyzing Saturday peak hour for retail developments and having representative traffic counts are required for that analysis. Considering school trips are not impacting our summer counts, the conservative summer adjustment factor proposed, and the more higher volume traffic/site traffic during the weekday peak hours, we feel adjusted Saturday counts will be representative for the analysis.

With this reasoning, please let me know if it's acceptable to move forward with the summer adjustment. I'm happy to set up a call to discuss further.

Thanks,

Subject: RE: (230553) Bronte Creek Meadows - TIS Terms of Reference - Trip Distribution and Summer Factor

Hi Greg,

Thank you for providing the Trip Distribution and Assignment letter. Transportation Planning is still in the process of reviewing the letter and we will provide feedback once the review is complete next week. If any questions or clarifications arise during the review, we'll reach out.

While I understand the rationale behind your proposed seasonal adjustment factor, I must advise that adjustment factors cannot be applied in this case. As per the terms of reference, traffic counts must avoid being collected during summer months. One of the reasons for this restriction includes the absence of school generated trips from Corpus Christi Catholic Secondary School, located immediately to the west of the development lands. Additionally, the OLT have made their position known to the City and Region that accepting traffic counts taken during non-standard periods cannot withstand strict scrutiny.
To avoid this situation, the following standard practices for collecting turning movement count data must be followed:

- The counts are conducted on a "typical" mid-week weekday (Tuesday, Wednesday or Thursday),
- Avoid counts during the Thanksgiving and Christmas holidays (mid-December to mid-January),
- Avoid counts during March Break, and
- Avoid counts during the summer (mid to late June to 1st week of September).

The City requires proceeding with collecting new traffic count data that adhere to the established terms of reference and the above-mentioned standard practices. Let me know if you need further clarification on this.

HI All,
Just following up on this to see if there were any comments on the trip distribution and assignment.

Additionally, as we collected counts during July, we wish to get comment on our summer adjustment factor before we get too far. Based on volumes along Appleby Line observed in July and September, we've observed a +14% adjustment for southbound traffic along Appleby Line but a -10% adjustment for northbound traffic. MTO QEW AADT data at the Appleby interchange shows a +8% seasonal variation between AADT and Summer AADT. Based on our observations we propose applying a +15% summer factor to all counts collected in July with some manual adjustments for continuity of traffic flow between neighbouring intersections.

Please let me know if you have any comment on the trip distribution or on the proposed summer adjustment factor.

Thanks !

Hi all,
Just following up on these action items. I reached out to the MTO and they've requested we include the Appleby Line ramps. As discussed, please see the attached Trip Distribution and Assignment letter which outlines the assumptions for the site trip distribution to the surrounding network and the Appleby MTSA. Please let me know if you have any comments/questions or would like to schedule a call to discuss. We appreciate you agreeing to take a look at this before the final TIS is submitted.

Hi Derek,
Thanks for providing those comments on the TOR. We have reviewed the comments provided by the City and wanted to discuss the expanded study area.

1. We do not feel that additional analysis along Appleby Line is warranted. Specifically, our preliminary site traffic forecasts estimate less than 250 vehicles per direction during the peak hours north of Upper Middle Road or south of Mainway. Based on the location, the primary access to the QEW will Burloak Drive. Site traffic along Appleby Line through the majority of the additional intersections listed will be north/south through traffic. I'm not sure what benefit the analysis will provide as it is unlikely further geometric and/or traffic control upgrades beyond the planned six-lane widening could be required.
2. The intersection of Old Burloak Drive & Burloak Drive (unsignalized) does not generate a significant volume. We will omit this intersection from the assessment; however we will discuss the implications of queue lengths from the upstream and downstream intersections.

Based on the above, we respectfully request you review the following and reconsider the need for an expanded study area.

Thanks,

Greg Lue, M.A.Sc., P.Eng.

Subject: RE: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference

Good afternoon,

Please find below the City's updates to the Terms of Reference. Please let me know if you have any questions and I hope you have a great weekend.

Terms of Reference

1. Study Area Intersections
   - Appleby Line & Fairview Street (signalized)
   - Appleby Line & Harvester Road (signalized)
   - Appleby Line & QEW EB Off-Ramp (signalized)
   - Appleby Line & QEW WB Off-Ramp (signalized)
   - Appleby Line & North Service Road (signalized)
   - Appleby Line & Appleby Ice Centre (signalized)
   - Appleby Line & Mainway (signalized)
   - Appleby Line & Corporate Drive (signalized)
   - Appleby Line & Upper Middle Road (signalized)
   - Appleby Line & Heron Way (signalized)
   - Appleby Line & Dryden Avenue (signalized)
   - Appleby Line & Taywood Drive (signalized)
   - Appleby Line & 2435 Appleby Line Outlet Mall (signalized)
   - Appleby Line & Dundas Street (signalized)
   - Appleby Line & Harrison Court (signalized)
   - Appleby Line & Thomas Alton Boulevard (signalized)
   - Appleby Line & Palladium Way (signalized)
   - Appleby Line & Highway 407 EB Off-Ramp (signalized)
   - Appleby Line & Highway 407 WB Off-Ramp (signalized)
   - Corpus Christi Catholic Secondary School West Driveway & Upper Middle Road (signalized)
   - Corpus Christi Catholic Secondary School East Driveway & Upper Middle Road (signalized)

- Quinte Street & Upper Middle Road (unsignalized)
- Sutton Drive & Upper Middle Road (signalized)
- Baker Drive & Upper Middle Road (unsignalized)
- Deer Place & Upper Middle Road (unsignalized)
- Blue Spruce Avenue & Upper Middle Road (unsignalized)
- Old Burloak Drive & Burloak Drive (unsignalized)
- Bronte Creek Provincial Park Access & Burloak Drive (unsignalized)
- Lampman Avenue/Norjohn Court & Mainway (unsignalized)
- Sutton Drive & Mainway (unsignalized)
- John Lucas Drive & Mainway (unsignalized)
- Burloak Drive & Mainway (signalized)
- Burloak Drive & North Service Road (signalized)
- Burloak Drive & QEW WB Off-Ramp (signalized)
- Burloak Drive & QEW EB Off-Ramp (signalized)
- Eight internal intersections

2. Existing Data
    - Traffic counts from 2023 are acceptable but 2024 traffic counts are preferred. The collection of any new TMC data must wait until at least mid September.

3. Horizon Years
    - 2024 Base Year
    - 2040 Horizon Year (Full Build-out)

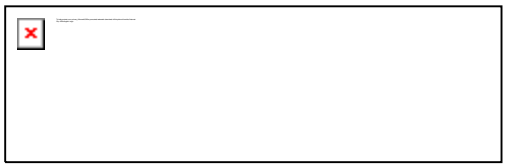
4. Analysis Periods
    - Weekday AM peak hour
    - Weekday PM peak hour

5. Analysis
    - Synchro 11
    - HCM 2000
    - SimTraffic Queueing (five 60-min iterations)

6. Background Traffic
    - Generalized growth rate 1% per annum for all City of Burlington roadways except along Fairview Street use 2% (a 2% percent growth rate accounts for the planned developments at Fairview St and Appleby Ln that are in early pre-con planning stages)
    - Background developments
        - 2273 Turnberry Road
        - Latch Development - 1989 Appleby Line
        - 5030-5045 Tico Creek Common
        - Millcroft Greens – 2155 Country Club Drive
        - 5219 Upper Middle Road
        - 1860-1900 Appleby Line

7. Site Traffic Estimates
    - ITE Trip Generation Data 11th Edition
    - No modal split reductions

8. Site Traffic Distribution
    - Existing travel patterns/TTS data



9. TDM Plan
    - Will outline existing and proposed TDM measures and assess their likely effectiveness for the proposed development.

10. Report
    - We will document the study methodologies, findings, and conclusions in a report with appendices containing the detailed analysis results and any data collected.
    - Mainway Multi-modal Level of Service (MMLOS) Study from Burloak Drive to Appleby Line.

11. Future Considerations
    - Future amendments, including MMLOS, will be required when the locations of future roads have been finalized.

Subject: RE: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference

Hi Greg,

Aside from our previously stated T of R comments by Halton Region, I have the following additional comments on your below items.

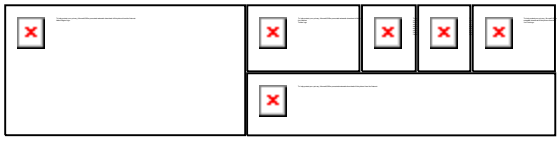
Growth Rates:

-since the application is for Local Official Plan Amendment, Zoning By-Law Amendment and Draft Plan of Subdivision, the 4% does not fully include the proposed residential development traffic generation & distribution
-the 4% along Burloak and Upper Middle Road, specifically for this area, is directly from Halton's EMME model and should not be adjusted/altered
-while not specifically from the model, the 4% will also account for local traffic using these roadways as opposed to staying on the at-capacity QEW westbound through the City, thus supporting the higher growth rate
-for the TIS Report recommendations, please clearly outline which area intersection mitigation measures are attributed to the development site traffic, and those attributed to background and total traffic volumes.

Intersection Plan:

The intersection plan included in the email does not match the one Halton Transportation Development Review staff commented on previously. Regardless, on our **attached** intersection plan we have labelled black dots the intersection

locations Halton would support as acceptable, based on surrounding existing conditions. Halton's intersection plan was previously included with our last comments as well. Please use this plan when making revisions to your draft plan and intersection locations, as part of the transportation impact study.



All other locations shown (right-in/right-out) will not be reviewed/supported until the submission of a transportation impact study. All intersections (full movement signalized) and accesses proposed (right-in/right-out) must be fully detailed and justified in the transportation impact study.

Lastly, any City of Burlington comments on the T of R, which I understand are forthcoming, will be supported by Halton Region.

Thanks,

Matt

Subject: (230553) Bronte Creek Meadows - Transportation Impact Study - Terms of Reference

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Hi all,
Thanks for providing comments on the Bronte Creek Meadows Terms of Reference. **City of Burlington**, please let me know if you have any additional comments.

With regards to the growth rate, the Region stated:

> *Halton's most up to date and acceptable growth rates (confirmed by Halton's Infrastructure Planning Policy group in April 2024) to use for this Study are as follows:*
> - *Burloak Drive north of Mainway: 4% to 2031 and then 1% from 2031 to 2041*
> - *Upper Middle Road west of Burloak Drive: 4% to 2031 and then 1% from 2031 to 2041*
> - *Appleby Line at Upper Middle Road: 2% to 2031 and then 1% from 2031 to 2041"*

The 4% per annum along Burloak and Upper Middle seems very high for this area which appears to be mostly developed except for the proposed site. Does the 4% include the proposed Bronte Creek Meadows development? I did a rough check of the Region's growth rate and it puts volumes into a similar range as applying 1% per annum growth rate plus the proposed development traffic so I worry that applying the 4% growth rate to this study would be double counting/overestimating traffic growth in the area.
Looking at the City of Burlington's development applications in the area, I've noted a few surrounding developments (attached) which will be included as background developments in the analysis. Would

the Region/City accept a 1% per annum growth rate on the roadways in addition to the five noted background developments traffic?

Please see below for an updated Terms of Reference:

Paradigm Transportations Solutions Limited has been retained to conduct a Transportation Impact Analysis for a proposed development located southeast of Upper Middle Road and Burloak Drive (Bronte Creek Meadows) in the City of Burlington. The property owner is proposing to develop the lands with a mixed-use subdivision including employment, institutional, retail, and variety of low, medium, and high-density residential uses in addition to park and open space. Vehicle access is proposed via connections to Upper Middle Road, Burloak Drive, and Mainway. A preliminary site concept is attached.

Based on the size of the development, a horizon year of 2040 is proposed to capture the full-build out of the development and the long-term transportation impacts and improvements that may be required to accommodate future traffic growth.

<u>Proposed Terms of Reference</u>

Study Area Intersections

- Appleby Line & Upper Middle Road (signalized)
- Corpus Christi Catholic Secondary School West Driveway & Upper Middle Road (signalized)
- Corpus Christi Catholic Secondary School East Driveway & Upper Middle Road (signalized)
- Quinte Street & Upper Middle Road (unsignalized)
- Sutton Drive & Upper Middle Road (signalized)
- Baker Drive & Upper Middle Road (unsignalized)
- Deer Place & Upper Middle Road (unsignalized)
- Blue Spruce Avenue & Upper Middle Road (unsignalized)
- Bronte Creek Provincial Park Access & Burloak Drive (unsignalized)
- Appleby Line & Corporate Drive (signalized)
- Appleby Line & Mainway (signalized)
- Lampman Avenue/Norjohn Court & Mainway (unsignalized)
- Sutton Drive & Mainway (unsignalized)
- Burloak Drive & Mainway (signalized)
- Burloak Drive & North Service Road (signalized)
- Burloak Drive & QEW WB Off-Ramp (signalized)
- Burloak Drive & QEW EB Off-Ramp (signalized)
- Eight internal intersections

Existing Data

- Weekday AM and PM counts collected on Sept 28, 2023
- Does the City/Region have any concerns with new Saturday traffic data being collected in the coming weeks?

Horizon Years

- 2024 Base Year
- 2040 Horizon Year

Analysis Periods

- Weekday AM peak hour
- Weekday PM peak hour
- Saturday peak hour

Analysis

- Synchro 11
- HCM 2000

- SimTraffic Queueing (five 60-min iterations)

Background Traffic

- Generalized growth rate 1% per annum
- Traffic generated by any in stream developments in the area. **City of Burlington**– can you comment on this and provide any relevant studies or inputs to estimate the traffic for the site(s)?

Future Network

- Widening of Burloak, Upper Middle Road, and Appleby from 4 to 6 lanes with the curb lanes converted to high occupancy vehicle (HOV) or bus rapid transit (BRT) lanes after completion of the road widening
- Widening to be assumed to be completed by 2032 and will be included in the future background and future total (with development) scenarios

Site Traffic Estimates

- ITE Trip Generation Data 11th Edition
- No modal split reductions

Site Traffic Distribution.

- Existing travel patterns/TTS data

Access Management

- Access management and spacing will be discussed
- Region proposed access locations will be considered. If different locations are proposed, justification will be provided for why they should be permitted.

TDM Plan

- Will outline existing and proposed TDM measures and assess their likely effectiveness for the proposed development

Report

- We will document the study methodologies, findings, and conclusions in a report with appendices containing the detailed analysis results and any data collected.

Thanks !

Greg Lue, M.A.Sc., P.Eng.
Project Manager, Associate
(he/him)

CITY OF Burlington

426 Brant Street • P.O. Box 5013 • Burlington • Ontario • L7R 3Z6 • www.burlington.ca

Meeting Minutes

Topic: **Bronte Creek Meadows TIS Terms of Reference Updates**

Date: **July 31, 2024 / 2:00 to 3:00 PM**

Virtual Attendees:

Derek Napoli, City of Burlington
Sandra Lucas, City of Burlington
Jaclyn Schneider, City of Burlington
Matt Krusto, Halton Region
Adam Huycke, Halton Region
Sara Gregory, Bousfields Inc.
Greg Lue, Paradigm Transportation Solutions Limited

Agenda Items

1. Bronte Creek Meadows Traffic Impact Study – Terms of Reference
   - Expanded list of study area intersections
     - Appleby Line intersections north of Upper Middle Road
     - Appleby Line intersections south of Mainway
     - Mainway and Burloak Drive unsignalized intersections
2. Bronte Creek Meadows Trip Distribution

Topics	Person Responsible	Action Items
Appleby Line intersections to include in TIS north of Upper Middle Road.	Greg Lue	Along Appleby Line, include only Dundas Street (RR 5) intersection.
Appleby Line intersections to include in TIS south of Mainway.	Greg Lue	Along Appleby Line, include Fairview Street, Harvester Road, North Service Road intersections.
Other unsignalized intersections from the Terms of Reference to be omitted from TIS along Mainway and Burloak Drive.	Greg Lue	Leave out Old Burloak Drive and John Lucas Drive intersections.

Highway 407 and QEW ramps to include in TIS.	Greg Lue	Follow up with MTO regarding the study of Highway 407 and QEW ramps.
Appropriate dates and times for conducting turning movement counts.	Greg Lue	Weekday and weekend turning movement counts (TMC) are preferably conducted outside of summer months (i.e., mid-June to mid-September). TMCs taken during summer months must use a seasonal adjustment factor to approximate typical traffic patterns.
Development trip distribution preliminary report.	Greg Lue	A preliminary Bronte Creek Meadows Trip Distribution report is to be submitted for review.

Simon Marshall, Project Coordinator, Dipl. T.
McMaster Innovation Park (MIP)
105-175 Longwood Road South
Hamilton, ON, L8P 0A1

Dear Mr. Marshall:

RE: MCMASTER INNOVATION PARK, TRIP AND PARKING GENERATION ESTIMATE

McMaster Innovation Park (MIP) retained **Paradigm Transportation Solutions Limited** to conduct this trip and parking generation study for the existing MIP lands (the park) located at 105-175 Longwood Road South in the City of Hamilton.

Project Understanding

The MIP is planning to update the master plan for the park. To assist in this update, Paradigm has prepared this letter summarizing existing trip and parking generation demand. **Figure 1** (attached) illustrates the location of the MIP lands. **Figure 2** illustrates the existing driveway accesses on site.

Existing Conditions

Currently, the MIP lands consist of three (3) buildings containing institutional, office, and commercial uses. The buildings and their general location within the lands are as follows:

- Atrium: office, laboratory, and conference building located within the northeast area of the site. Driveway access is provided to Longwood Road and Frid Street;
- CanmentMATERIALS (CMAT): a large institutional research centre immediately south of Atrium building. Driveway access is provided to Frid Street.
- McMaster Automotive Resource Centre (MARC): laboratory building located west of the driveway to Longwood Road opposite Frid Street. This building includes the Biomedical Engineering and Advanced Manufacturing (BEAM) and Commercialization Facility.

The MIP generally operates from 06:00 hr to 20:00 hr on weekdays with weekend activity limited to a small number of persons and may periodically host a special event. The daily MIP population is approximately 830 persons with a parking supply of 725 parking spaces distributed through 10 lots within the Park.

At the time of this study, portions of Lot 1 and Lot 2 were fenced off to support the construction activity associated with the Commercialization Facility. The construction activity is anticipated to end by January 2020. Lot 4 and 6 had areas which were distinguishably reserved for permit parking and visitor parking. As a result, the existing number lots have been split into smaller parking areas to capture parking activity adequately.

Figure 3 (attached) illustrates the general location of the on-site parking areas and **Figure 4** (attached) details the west area parking lots. **Table 1** summarizes the current parking supply for the MIP.

TABLE 1: EXISTING PARKING SUPPLY

Lot	Type	Parking Supply at Time of Survey
Lot 2	Permit	206
Lot 1 - North	Visitors	8
Lot 1 - A	Visitors	21
Lot 1 - B	Visitors	16
Lot 4	Permit	39
Lot 6 - North	Permit	17
Lot 1 - C	Visitors	20
Lot 6 - A	Permit	30
Lot 1 - South	Visitors	24
Lot 6 - South	Permit	37
Lot 5	Overflow/Conference	74
Lot 1 - North	Visitors	59
Lot 3	Permit	155
Lot 1 - A	Visitors	9
Lot 1 - South	Visitors	10
Subtotal Visitor Parking		**167**
Subtotal Permit Parking		**484**
Subtotal Overflow/Conference		**74**
Total Parking Supply		**725**

Existing Trip Generation

Trip generation survey counts at the MIP took place during two (2) separate weekdays in October 2019 over a 24-hour period on the following days: Wednesday, October 9th and Thursday, October 17th. The counts were undertaken at 3 driveway connections to the site:

- Location A: Longwood Road at the Atrium building driveway on the east side of the site;
- Location B: Longwood Road at the right-in/right-out driveway to the MARC building on the west side of the site; and
- Location C: Longwood Road at the Frid Street signalized intersection.

Based on the counts observed, the peak hour of the adjacent roadway (Frid Street) is occurring from 7:45 AM to 8:45 AM. Similarly, the peak hour of the site generator is from 8:00 AM to 9:00 AM. The daily trip generation for both days is in the order of 2.38-2.46 trips per person.

These results are summarized in **Table 2** below. The turning movement count data from both days is provided in **Appendix A**.

TABLE 2: EXISTING TRIP GENERATION

Date	Time Period	Peak Hour	Hour Ending	Total Generation	In	Out	% In	% Out	Rate/ Person

	Peak Hour of Generator	AM	09:00	248	209	39	84%	16%	0.30
		Mid-Day	13:15	174	93	81	53%	47%	0.21
		PM	17:00	206	43	163	21%	79%	0.25
		Daily	n/a	2,044	1,049	39	51%	49%	2.46

Existing Parking Generation

Weekday parking demand data was collected on two separate weekdays during October 2019 during normal operations of the MIP. The parking demand data was collected in 60-minute intervals during typical MIP operations. The survey periods assessed include:

- Day 1 – Wednesday, 09 October 2019 from 06:00 hr to 20:00 hr.; and
- Day 2 – Thursday, 17 October 2019 from 06:00 hr to 20:00 hr.

Vehicle Parking Generation

Vehicle parking demand has been summarized for each survey day based on demand by lot, demand by use, and the temporal distribution:

- Parking demand by lot - **Table 3**;
- Parking demand by use (visitor/permit/overflow) - **Table 4**; and
- Temporal distribution - **Figure 5** (attached)

The parking data is summarized in **Appendix B**. The following parking characteristics are noted:

- The MIP is operating with a parking surplus during all time periods examined;
- Peak parking demand is approximately 416-445 vehicles and typically occurs mid-day around 11:00 AM;
- Parking supply is utilized 55-60 percent;
- Average parking demand is 0.52-0.56 spaces per person; and
- Lot 2 and 3 contain approximately 50 percent of the MIP parking supply and accommodates 65-75 percent of the parking demand.

As a general comparison, the following parking characteristics are noted from the 2017 study:

- The MIP is operating with a parking surplus during all time periods examined;
- Peak parking demand for the MIP is approximately 370-410 vehicles and typically occurs mid-day around 11:00 AM;
- Parking supply is utilized 45-50 percent;
- Average parking demand per person is 0.46-0.51 spaces per person; and
- Lot 2 and 3 contain approximately 45 percent of the MIP parking supply and accommodate approximately 60-70 percent of the parking demand.

Bicycle Parking Demand

Bicycle parking demand data for the same survey periods was also collected. The parking data is summarized in **Appendix B**. **Table 5** summarizes the observed bicycle parking demand by area for the MIP on both October 9th and October 17, respectively.

The estimated bicycle parking supply is 80 spaces consisting of post-ring racks, bike stands, and a Sobi Bicycle hub. Bicycle parking is less structured vs. vehicular parking, as bicycles can be locked to street furniture and other objects. The following bicycle parking characteristics are noted:

- Peak bicycle parking demand for the MIP is approximately 30 bicycles and typically occurs mid-day around 12:00 PM;
- Bicycle parking supply is 35 percent utilized;
- Bicycle parking in the courtyard area appears to be greater than the rest of the MIP; and
- Average bicycle parking demand equates to 0.04 bicycle parking spaces per 10 persons. As a general comparison, the City's Transportation Demand Management (TDM) Policy for Institutional developments suggests a bicycle parking supply rate of 1 space per 10 students.

As a general comparison, the following parking characteristics are noted from the 2017 study:

- Peak bicycle parking demand for the MIP is approximately 10 bicycles and typically occurs mid-day around 11:00 AM;
- 10 percent of the site's bicycle parking supply is utilized;
- Bicycle parking for the MARC building appears to be greater than the rest of the MIP; and
- Average bicycle parking demand equates to 0.06 bicycle parking spaces per 10 persons.

Conclusions

Based on the parking characteristics observed between 2019 (current) and 2017, the following conclusions can be made:

- The MIP continues to operate with a parking surplus during all examined time periods.
- The existing peak parking demand has increased from a maximum of 410 vehicles in 2017 to 445 vehicles currently. Peak demand still operates during the same time of day, mid-day around 11:00 AM.
- Parking supply utilization has increased from 45-50 percent in 2017 to 55-60 percent in 2019.
- Average parking demand per person has increased from 0.46-0.51 in 2017 to 0.50-0.54 in 2019.
- Lots 2 and 3 continue to accommodate the highest parking demand on site. The demand on these lots has increased from 60-70 percent in 2017 to 65-75 percent in 2019.
- Lots 2 and 3 contain approximately 50 percent of the MIP total supply currently, versus 45 percent in 2017.
- Peak bicycle parking demand from 2017-2019 has tripled from 10 bikes to 30 bikes with peak demand remaining consistent during the mi-day; between 11:00 AM and 12 PM.
- Utilization of the site's total bicycle parking supply has increased significantly from 10 percent in 2017 to 35 percent currently.
- The courtyard parking area is utilized more now versus the MARC area 2017.
- Average bicycle parking rate is 0.04 spaces per 10 persons currently versus 0.06 spaces per 10 persons as documented in 2017.

We trust that this information adequately addresses the work completed on this file.

Intersection Summary	
Area Type:	Other
Cycle Length: 120	
Actuated Cycle Length: 120	
Offset: 87 (73%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green	
Natural Cycle: 110	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 0.82	
Intersection Signal Delay (s/veh): 30.7	Intersection LOS: C

Intersection Capacity Utilization 83.2% ICU Level of Service E
Analysis Period (min) 15
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 123: Appleby Line & Harvester Road

Intersection Summary	
Area Type:	Other
Cycle Length: 120	
Actuated Cycle Length: 120	
Offset: 56 (47%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green	
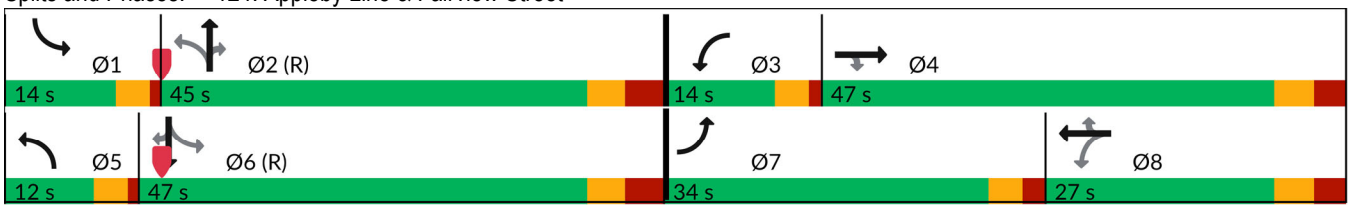
Natural Cycle: 135	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 0.91	
Intersection Signal Delay (s/veh): 39.4	Intersection LOS: D

Intersection Capacity Utilization 83.0% ICU Level of Service E

Analysis Period (min) 15



* User Entered Value

\# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 124: Appleby Line & Fairview Street

* User Entered Value

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary	
Area Type:	Other
Cycle Length: 120	
Actuated Cycle Length: 120	
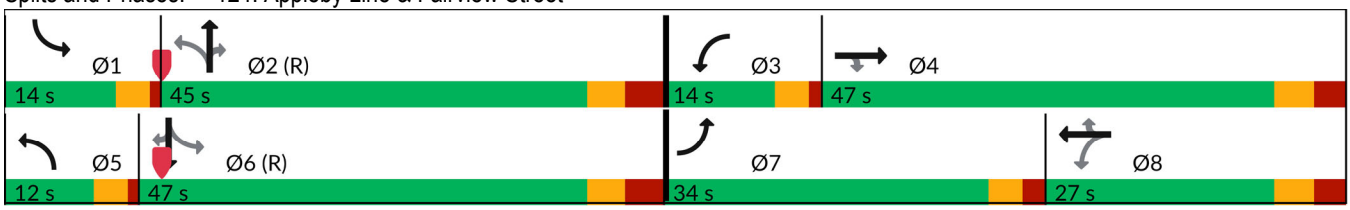
Offset: 56 (47%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green	
Natural Cycle: 145	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 1.08	
Intersection Signal Delay (s/veh): 52.9	Intersection LOS: D

Intersection Capacity Utilization 88.7%	ICU Level of Service E
Analysis Period (min) 15	



* User Entered Value

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 124: Appleby Line & Fairview Street

Intersection Summary	
Area Type:	Other
Cycle Length: 142	
Actuated Cycle Length: 142	
Offset: 0 (0%), Referenced to phase 4:NBT and 8:SBT, Start of Green	
Natural Cycle: 135	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 0.97	
Intersection Signal Delay (s/veh): 48.8	Intersection LOS: D

Intersection Capacity Utilization 101.1% ICU Level of Service G

Analysis Period (min) 15

\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Splits and Phases: 101: Appleby Line & Dundas Street

Intersection Summary	
Area Type:	Other
Cycle Length: 120	
Actuated Cycle Length: 120	
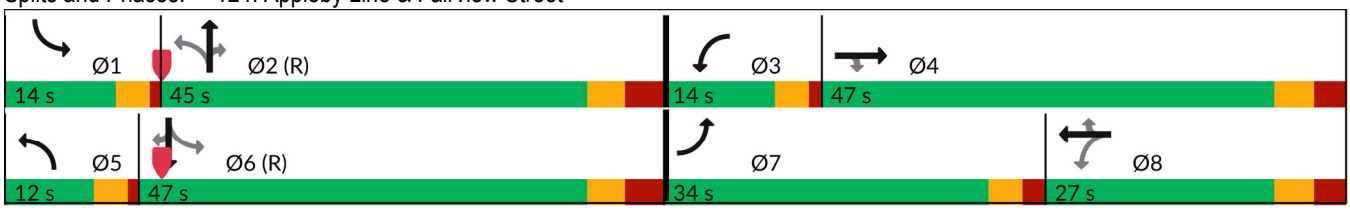
Offset: 56 (47%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green	
Natural Cycle: 145	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 1.19	
Intersection Signal Delay (s/veh): 67.6	Intersection LOS: E

Intersection Capacity Utilization 95.1%	ICU Level of Service F
Analysis Period (min) 15	



* User Entered Value

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 124: Appleby Line & Fairview Street

Intersection Summary	
Area Type:	Other
Cycle Length: 142	
Actuated Cycle Length: 142	
Offset: 0 (0%), Referenced to phase 4:NBT and 8:SBT, Start of Green	
Natural Cycle: 125	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 0.91	
Intersection Signal Delay (s/veh): 46.0	Intersection LOS: D

Intersection Capacity Utilization 97.3% ICU Level of Service F

Analysis Period (min) 15

\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Splits and Phases: 101: Appleby Line & Dundas Street

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary	
Area Type:	Other
Cycle Length: 120	
Actuated Cycle Length: 120	
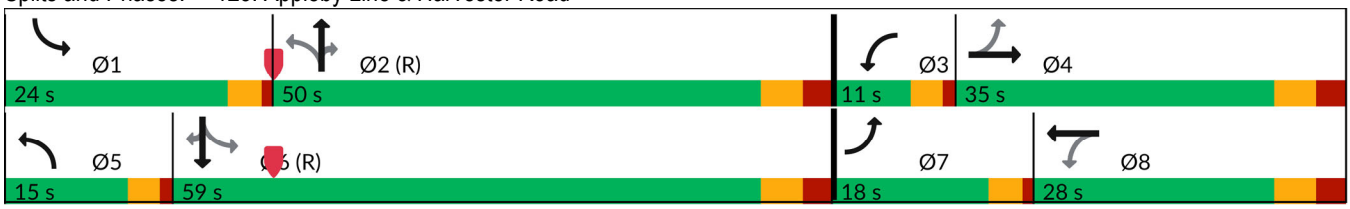
Offset: 87 (73%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green	
Natural Cycle: 110	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 0.97	
Intersection Signal Delay (s/veh): 31.3	Intersection LOS: C

Intersection Capacity Utilization 89.0% ICU Level of Service E



Analysis Period (min) 15

* User Entered Value

\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 123: Appleby Line & Harvester Road

Intersection Summary	
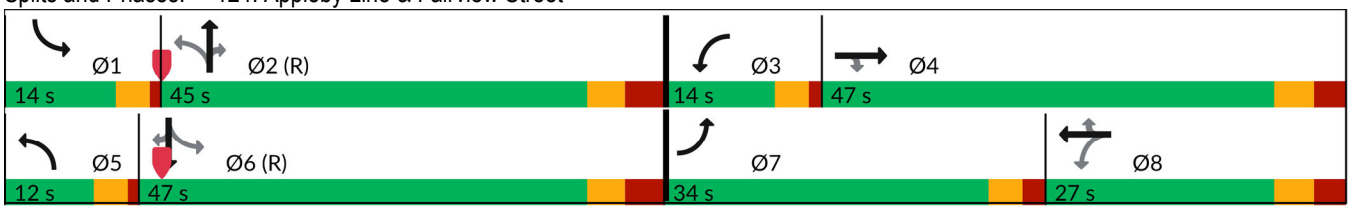
Area Type:	Other
Cycle Length: 120	
Actuated Cycle Length: 120	
Offset: 56 (47%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green	
Natural Cycle: 135	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 0.98	
Intersection Signal Delay (s/veh): 43.2	Intersection LOS: D

Intersection Capacity Utilization 84.9%	ICU Level of Service E
Analysis Period (min) 15	



* User Entered Value

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 124: Appleby Line & Fairview Street

* User Entered Value
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 106: Sutton Drive & Upper Middle Road
