1.0 INTRODUCTION

MTE Consultants Inc. (MTE) has been retained by Alinea Land Corporation to complete the Stormwater Management design in support of an application for Phase 1 Draft Plan of Subdivision Approval for their Upper Middle Road & Burloak Drive property in the City of Burlington. The property is also known as the Bronte Creek Meadows Phase 1 Subdivision and is referred to herein as the 'Subject Lands'.

The Subject Lands comprise an irregular shaped area of vacant lands of approximately 49.358 hectares (122.9 acres), and are part of a 123.1 ha land block owned by Alinea located south of the intersection of Upper Middle Road and Sutton Drive as shown in Figure 1.0 The Subject Lands are located in the south portion of the larger block which is bounded by Upper Middle Road (Halton Regional Road 38) to the northwest, Burloak Drive (Halton Regional Road 21) to the northeast, Mainway to the southeast, and existing development to the southwest, which includes Corpus Christi Catholic Secondary School and low rise residential development (Falconcrest Drive, Hobson Drive, Creek Way and the dead-ended Corporate Drive). The Subject Lands include agricultural fields, a woodlot measuring approximately 12ha which abuts Mainway and multiple watercourses. Sheldon Creek (Sheldon Creek West Branch; SCWB), which is within the Conservation Halton (CH) Regulation Limit, passes through the southern portion of the Subject Lands in a generally west to east direction. Two smaller watercourses, being a tributary to Sheldon Creek (Sheldon Creek East Branch; SCEB) and a tributary to Bronte Creek, also within the CH Regulation Limit, flow adjacent to and through the northeast portion of the larger Alinea block in a northwest to southeast direction. A few unregulated, poorly defined flow paths are also present on the Subject Lands. A woodlot known as Sheldon Creek Woodlot is located just north of Sheldon Creek, within a landlocked parcel owned by the City of Burlington measuring approximately 9.1ha, surrounded by the Subject Lands.

There is a 20m wide Hydro One corridor adjacent (and external) to the northwest limits of the Subject Lands between the Subject Lands and Upper Middle Road, on which a hydro pole line with approximately six overhead hydro cables runs parallel to Upper Middle Road along the entire frontage of the Subject Lands. Within the Subject Lands adjacent to the hydro corridor, there is an 18.28m wide Enbridge easement which contains twin 508mm high pressure underground oil pipelines, both of which are currently inactive.

2.2 Topographical Information

McKay, McKay & Peters Limited (MMP) completed a detailed topographic survey of the Subject Lands on July 28, 2023. The existing topography of the Subject Lands is shown on MMP drawings and MTE Drawing No. **52982-104 P-EST1.1.1, EST1.1.2**, enclosed.

Much of the Subject Land is relatively flat with elevations ranging from 141.9 to 129.5 m sloping generally from northwest to southeast at slopes generally on the order of 1-2%. Sheldon Creek, at the south end of the Subject Lands, is in a valley approximately 6-10m lower than the surrounding lands.

The Subject Lands are bounded in the northwest by Upper Middle Road and the existing Corpus Christi school and have approximately six drainage area splits along this boundary, each flowing southeasterly. One of the drainage areas receives inflow from the neighbouring subdivisions northwest of Upper Middle Road with their flows entering the Subject Lands via a large culvert beneath Upper Middle Road.

At the southeast limit of the Subject Lands, SCEB crosses Mainway via a large box culvert.

Within the open fields of the site, several smaller undefined flow paths convey runoff downstream towards Mainway. These flow paths are labelled on MTE Drawing No. **52982-104 P-EST1.1.1 and P-EST1.1.2** as defined by Terrastory, being SC-1, SC-2, SCT-1 through SCT-13, Sheldon Creek Side Channel, where SC, and SCT indicate that the flow paths discharge directly to either Sheldon Creek, or to Sheldon Creek Tributary.

2.3 Geotechnical Information

A Geotechnical investigation of the Subject Lands was completed by MTE Consultants Inc. and included advancement of 70 boreholes across the Subject Lands to depths from 2.3 to 7.5m below ground surface (mbgs). The resultant geotechnical report (Ref. 12) includes the following key information:

Topsoil & Fill

Topsoil was encountered across the Subject Lands in all boreholes, at thicknesses from 150mm to 360mm. In 22 of the boreholes, fill materials were encountered directly below the topsoil layer, at thicknesses ranging from 0.3 to 0.9m. It is recommended that this fill material be removed from any building footprint areas. It is further noted that this fill material can be used in landscaped areas.

Native Soils

Native site soils generally including glacial till deposits, with sand, silt and clay deposits in four boreholes.

Bedrock

Shale bedrock was encountered in all boreholes, at elevations ranging from 127.8m – 140.4m, at depths varying from 1.1m – 4.6mbgs. Two boreholes encountered limestone bedrock deposits at depths of 1.1 mbgs and 3.0 mbgs.

Groundwater

Groundwater was encountered in 16 of the 70 boreholes at the time of drilling, at depths from 1.5mbgs to 6.1mbgs. Ten (10) monitoring wells were installed.

Findings & Recommendations

Key findings and recommendations of the geotechnical investigation are as follow:

- Topsoil and fill should be stripped and stockpiled at the start of grading activities;
- The majority of the native soils as well as re-worked native soils above the groundwater table are suitable for reuse as engineered fill provided they are near the optimum moisture content for compaction purposes;
- The removed topsoil and fill are suitable for use in landscaped areas;
- The subgrade soils are susceptible to disturbance therefore construction traffic on the subgrade should be minimized;
- Structural fill used for raising grades beneath the proposed buildings should comprise of granular material such as OPSS Granular 'A' or 'B';
- Subgrade fill material beneath pavement areas and services should meet the requirements of OPSS Select Subgrade Material;
- Fill operations should be carried out in the dry summer months;
- Minor groundwater seepage should be expected where excavations extend into saturated seams. Minor to moderate groundwater seepage should be expected as excavations proceed through the shale bedrock. Sump pumps should be adequate to handle nuisance dewatering from the seepage. An MECP Permit to Take Water would be required if dewatering of more than 50,000 L/day is required;
- Shale should not be used as trench backfill;
- Pavement Design:

Pavement Component	Light Duty	Heavy Duty
Asphalt Hot Mix	90mm	110mm
OPSS 1010 Granular 'A' Base	150mm	150mm
OPSS 1010 Granular 'B' Subbase	350mm	450mm

- SWM facility sides above the high-water level should be sloped at 5:1 H:V to mitigate erosion;
- SWM facility berming should be cut at slopes of 3:1 to 5:1 H:V depending on the soils encountered.
- If the SWM facility will extend into the shale bedrock, a geosynthetic liner may be required due to the fractures in the bedrock allowing water permeability. Native cohesive glacial tills on site should be suitable for use as the pond liner.

2.4 Hydrogeological Information

A Hydrogeological assessment of the Subject Lands was completed by MTE Consultants Inc. The resultant preliminary hydrogeological assessment report (Ref. 17) includes the following key information:

Groundwater

- Groundwater elevation measurements taken from the on-site monitoring wells which were installed within the weathered shale bedrock ranged between approximately 126.0m to 140.3m.
- Groundwater elevations in piezometer locations within native fill deposits (aquitard) ranged between 124.2m and 138.9m.

Wetlands

- The primary source of water to the monitored wetland and surface water features are surface water runoff with limited to no groundwater contribution.
- The presence of low permeability soils underneath the wetland features may limit the downward percolation of groundwater into the shallow weathered bedrock.

Groundwater Flow

- Groundwater flow is interpreted southeast toward Lake Ontario, with a horizontal hydraulic gradient varying between approximately 0.009m/m to 0.024m/m.

Hydraulic Conductivity

- Infiltration rates of native till deposits are estimated to range from 8mm/h – 18mm/hr. A safety correction factor has not been applied and should be selected by the design engineer utilizing the hydraulic conductivity in their design.
- Hydrologic conductivity of the weathered shale bedrock is estimated to be on the order of 10^{-10} m/s to 10^{-6} m/s.

Infiltration Considerations

- Due to the low permeability of soils and high groundwater, Low Impact Development (LID) measures that rely on infiltration do not appear feasible within the Subject Lands.

Construction Dewatering

- Temporary construction dewatering may be needed during site servicing and construction of building foundations. An Environmental Activity and Sector Registry registration with MECP may be required for temporary construction dewatering.

Groundwater Quality

- The potential for effects on groundwater quality from infiltration in the proposed development is likely to be limited. Any potential changes to the shallow groundwater quality are not expected to influence the surface water quality in the onsite surface water and wetland features considering the limited groundwater discharge to these features.

Wells

- No municipal or private water supply wells are anticipated to be impacted by the proposed development.

2.5 Natural Heritage System

Several Natural Heritage System (NHS) features have been identified within Phase 1 by Terrastory Environmental Consulting Inc. In the context of stormwater management, these NHS features are limited to wetlands. Wetlands identified as SCW-1, SCW-2 and SCW-3 are within the Sheldon Creek Woodlot. A brief description of each wetland is provided in **Table 2.1**.

Table 2.1 – Wetlands

Identification	Location	Primary Water Source
SCW-1	Within Sheldon Creek Woodlot, south	Surface water fed from SCT-9
SCW-2	Within Sheldon Creek Woodlot, central	Surface water fed from SCW-1
SCW-3	Within Sheldon Creek Woodlot, north	Surface water fed from SCT-6 and SCT-6a

3.0 DEVELOPMENT CONCEPT

The Draft Plan for the Subject Lands (included in **Appendix A**) includes residential, mixed-use, school, employment, commercial, park, natural heritage system, woodlot compensation and open space lands as well as municipal road allowances.

4.0 STORMWATER MANAGEMENT

4.1 General

Due to the size of the Subject Lands and the complexity of the associated pre- and post-development drainage systems, a number of Points of Interest (POI) have been identified. Generally, a POI has been established at the upstream end of each important NHS feature, at key locations where runoff from external lands enter the Subject Lands, and at locations where pre- and/or post-development discharge from the Subject Lands is proposed. POI locations are indicated on relevant drawings and figures.

4.2 Criteria

SWM criteria for the development have been established to meet three goals: satisfy the general SWM criteria set out by the City for any development, respect existing infrastructure, and support NHS features within the Subject Lands.

4.2.1 General SWM Criteria

The general stormwater management design criteria for the Subject Lands are as follows:

Flood Control

Attenuate the post-development peak flow for the Regional (i.e., Hurricane Hazel) storm event to the pre-development (existing) peak flow.

Quantity Control

Attenuate the post-development peak flows for the 2 to 100-year storm events to the pre-development (existing) peak flows.

Erosion Control

Provide extended detention control to release the 4-hour, 25mm storm event over 48 hours.

Water Budgets

Maintain a post to pre-development surface water annual recharge to the regulated wetlands within the study area as per the Bronte Creek Meadows Scoped Subwatershed Study.

Water Quality Control

Provide Level 1 (Enhanced; 80% Average Annual Removal of Total Suspended Solids) water quality treatment.

4.2.2 Infrastructure-Based SWM Criteria

Under existing conditions, runoff from portions of the Subject Lands is discharged to existing storm sewers at various locations surrounding the site. It is important that the capacity of these sewers is not exceeded as a result of development of the Subject Lands. As such, an additional criterion has been set to control the post-development peak flow rate to the pre-development level at each existing inlet.

4.2.3 NHS Feature-Based SWM Criteria

In addition to the general criteria set out by the City, several additional criteria related to NHS features within the Subject Lands have been set. Generally, these include matching pre-development flow contributions to wetlands under post-development conditions. Specific information related to these locations and flow targets is included in subsequent sections.

4.3 Low Impact Development (LID) Considerations

The hydrogeological assessment for the Subject Lands (Ref. 15) estimates the coefficient of hydraulic conductivity of the bedrock to range from 10^{-10} to 10^{-6} m/s and estimates the infiltration rate of the silt till soils to be 8-18mm/hr, excluding a design safety factor. Applying a Safety Correction Factor of 2.5 to these rates yields Design Infiltration Rates of 3.2-7.2 mm/hr. The hydrogeological assessment report concludes that the use of LIDs does not seem feasible for the Subject Lands.

A screening of potential Low Impact Development (LID) measures has been completed for the project, in accordance with the Low Impact Development Stormwater Management Planning and Design Guide Version 1.0 (Ref. 6). A summary of the screening of each LID measure considered for the project is included in **Table 4.1**.

Table 4.1 – Summary of Low Impact Development Screening

LID Measure	Degree of Feasibility	To Be Implemented on Site? (Yes/No/ Maybe)	Discussion
Lot-level Rain Barrels	Feasible	Maybe	Lot-level rain barrels are feasible on site and would provide a measure of stormwater quantity control. Whether to implement or not is to be determined at the detailed design stage.
Lot-Level Cisterns	Feasible	No	Lot-level cisterns could provide SWM quantity control for the development. However, a more efficient result can be achieved with a communal SWM facility. Lot-level cisterns on non-low rise residential blocks is to be considered at the Site Plan design stage for each Block.
Green roof	Somewhat	Maybe	Green roof technology is not suited to sloped, low- and medium-density residential rooftops. Green rooves on non-low rise residential blocks is to be considered at the Site Plan Application stage for each Block.
Roof Downspout Disconnection	Feasible	Yes	Suitable, but will realize limited effectiveness due to short permeable flow path from downspout to roadway.
Soakaways, Infiltration Trenches or Chambers	Limited	Maybe	Soakaway pits may be proposed on Single Detached and Townhouse lots where depth to groundwater and depth to bedrock allows. To be explored at the detailed design stage.
Bioretention	Yes	No	No suitable location on plan.
Biofilter (filtration only Bioretention design)	Not Feasible	No	No suitable location on plan.
Vegetated Filter Strip	Yes	Maybe	To be explored at the detailed design stage.
Permeable Pavement	Yes	Maybe	May be considered at the Site Plan Application stage for non-low rise residential development blocks.
Increased Topsoil Depth	Feasible	Yes	Increased topsoil depth (up to 0.3m depth) can be utilized on all lots, increasing the soil water storage volume and infiltration potential.
Enhanced Grass Swale	Not feasible	No	No suitable location on plan.
Dry Swale	Not feasible	No	No suitable location on plan.
Perforated pipe system	Not feasible	No	Due to the high groundwater table and low infiltration potential of site soils, perforated storm sewers are generally not feasible in this development.

4.4 Methodology

In order to successfully complete the stormwater management design for this site, the following specific tasks were undertaken:

1. Determine the location of Points of Interest (POI) at which hydrologic information is important;
2. Prepare existing conditions hydrologic modeling to ascertain flow rates at each POI under the various design storms;
3. Determine the percent impervious of the site and catchment area parameters for inclusion in hydrologic modelling;

- Calculate post-development runoff hydrographs using a Visual Otthymo (VO) software model for each POI; and
- Design stormwater management measures to provide water quality and quantity controls as needed to meet the Stormwater management criteria.

4.5 Pre-Development Conditions

Under pre-development conditions, the Subject Lands were defined by 20 sub-catchments. One external sub-catchment area was also delineated adjacent to the Subject Lands. **Drawing EST1.1.1, EST1.1.2** provides an illustration of the sub-catchment areas, and **Table 4.2** provides a brief description of each sub-catchment area as well as the design parameters used in the hydrologic modeling.

Table 4.2 – Pre-Development Catchment Parameters

Sub-Catchment	Description	Area (ha.)	% Impervious	Pervious CN [1]
106	Ploughed field draining to Mainway at POI-13	18.31	0	85
107	Ploughed field draining to Sheldon Creek Woodland at POI-9	6.75	0	85
108	Ploughed field draining to Sheldon Creek valley at POI-2	0.67	0	85
109	Ploughed field draining to Sheldon Creek valley at POI-3	2.14	0	85
110	Ploughed field draining to Sheldon Creek Woodland at POI-6	2.67	0	85
111	Ploughed field draining to Sheldon Creek valley at POI-4	0.78	0	85

Total	**77.81**	**53.32**		

[1] Pervious CN of 85 based on SCS Soil Class C, Row Crops. Pervious CN of 77 based on SCS Soil Class C, Woods. (Ref. 3, Design Chart 1.09).

In order to establish SWM quantity control targets at each important location in and around the Subject Lands, 17 Points of Interest (POI) have been identified. Each POI is described in **Table 4.3**, and is illustrated on **MTE Drawing P-EST1.1, EST1.1.2 – Preliminary Pre-Development Catchment Areas**.

Table 4.3 – Points of Interest

Point of Interest	Description	Sub-Watershed
POI-2	West limit of the Subject Lands at Sheldon Creek.	Sheldon Creek
POI-3	West limit of the Subject Lands at Sheldon Creek.	Sheldon Creek
POI-4	West limit of the Subject Lands at Sheldon Creek.	Sheldon Creek
POI-5	Downstream development limit of the Subject Lands at Mainway and Sheldon Creek.	Sheldon Creek
POI-6	West edge of Sheldon Creek Woodland, at upstream end of SCT-9. Flow from this point feeds SCW-1.	Sheldon Creek Tributary
POI-7	Downstream of Sheldon Creek Woodland, on SCT-1. This receives flow from a portion of SCW-1.	Sheldon Creek Tributary
POI-8	Upstream development limit of the Health Care Campus within the Subject Lands. This receives flow from a portion of SCW-1 and SCW-2.	Sheldon Creek Tributary
POI-9	North edge of Sheldon Creek Woodland, at downstream end of SCT-6 and SCT-6a. Flow from this point feeds SCW-3.	Sheldon Creek Tributary
POI-10	Upstream development limit of the Health Care Campus within the Subject Lands. This is the proposed downstream limit of SCW-3.	Sheldon Creek Tributary
POI-11	Downstream development limit of the Subject Lands at Mainway, ~70m east of John Lucas Drive, at existing CB which captures and	Sheldon Creek Tributary

Point of Interest	Description	Sub-Watershed
	conveys flow to Sheldon Creek Tributary via storm sewers along Mainway and John Lucas Drive.	
POI-12	West edge of Sheldon Creek Woodland, at upstream end of SCT-9. Flow from this point feeds SCW-1.	Sheldon Creek Tributary

City of Burlington 2020 design rainfall (Intensity-Duration-Frequency) parameters used in hydrologic modeling are listed in **Table 4.4**.

Table 4.4 – IDF Parameters

Storm Event	Rainfall Parameter		
	A	B	C
25mm Water Quality [1]	458.01	6	0.780
2-Year	681.52	6	0.780
5-Year	802.04	5	0.764
10-Year	918.28	5	0.763
25-Year	1065.95	5	0.762
50-Year	1172.34	5	0.761
100-Year	1281.34	5	0.761

[1] 25mm WQ parameter A derived by factoring (2-year "A" of 681.52) * (25mm desired rainfall depth) / (2 years rainfall depth of 37.2mm)

To be consistent with the hydrologic modeling completed as part of the recent Sheldon Creek hydrology study (Ref. 11), the SCS rainfall distribution and storm duration of 12 hours were used in all modeling except for the 25mm WQ event. In accordance with the recommendations of the SSWS (Ref. 18), the 25mm Water Quality event has used the Chicago distribution and a duration of 4-hours. The Regional storm used Antecedent Moisture Condition (AMC) III.

Using the design parameters listed in the above tables, pre-development peak flow rates were established at each POI using the Visual Otthymo (VO) hydrologic modeling software for the 25mm Water Quality as well as the 2-, 5-, 10-, 25-, 50- and 100-year design storm events. The resultant peak flow rates are shown in **Table 4.5**.

Table 4.5 – Pre-Development Peak Flow Data (m^3/s)

POI	Rainfall Event							
	25mm WQ	2-Year	5-Year	10-Year	25-Year	50-Year	100-Year	Regional
2	0.018	0.042	0.064	0.080	0.100	0.116	0.131	0.097
3	0.046	0.110	0.17	0.211	0.265	0.305	0.345	0.304
4	0.026	0.059	0.091	0.112	0.141	0.162	0.183	0.112

POI	Rainfall Event							
	25mm WQ	2-Year	5-Year	10-Year	25-Year	50-Year	100-Year	Regional
6	0.055	0.131	0.203	0.253	0.318	0.367	0.415	0.377
7	0.076	0.180	0.278	0.346	0.436	0.504	0.570	0.495
8	0.068	0.160	0.249	0.310	0.390	0.451	0.510	0.435
9	0.116	0.285	0.443	0.551	0.693	0.801	0.906	0.924
10	0.138	0.334	0.521	0.649	0.817	0.945	1.070	1.065
11	0.159	0.382	0.592	0.736	0.925	1.068	1.207	1.109
12	0.459	1.098	1.700	2.116	2.666	3.083	3.490	3.135

The flow rates listed in **Table 4.5** have been set as the maximum allowable post-development peak flows at each POI.

Pre-development hydrologic modeling output files, along with a pre-development hydrologic connectivity schematic, are included in **Appendix B**.

4.6 SWM Strategy

The SWM strategy for the Subject Lands includes discharging treated stormwater to various NHS features within and downstream of the development, including woodlots and wetlands. Runoff from the majority of the development lands is discharged through wet pond SWM facilities.

Specific SWM measures for the project include two wet pond SWM facilities, and lot-level infiltration measures.

SWMF1

SWMF1 is located east side of the Phase 1 lands and captures and treats runoff from the majority of the development lands. Due to grading constraints, it is not feasible to direct runoff from Employment Block 238 to the SWM facility.

The inlet to SWMF1 is located at Sutton Drive. SWMF1 outlets to the Sheldon Creek East Branch just upstream of the Mainway Woodland.

SWMF2

SWMF2 is located southeast of Sheldon Creek West Branch and captures and treats runoff from the Phase 1 lands south of the Sheldon Creek Woodlot.

The inlet to SWMF2 is located north of Mainway and its outlet discharges to the Sheldon Creek West Branch and existing storm sewer on Mainway.

Surface water recharge to wetlands SCW-1, SCW-2 and SCW-3 is provided using two ‘third pipe’ storm sewer networks designed to capture clean runoff from rooftops and convey it to these wetlands. The extent of each ‘third pipe’ network has been sized in order to closely match pre-development wetland surface water recharge volumes during relevant portions of the year as discussed in greater detail in subsequent subsections.

4.7 Post-Development Conditions

Under post-development conditions, the study area was delineated into 16 sub-catchments, including 15 within the Subject Lands and one external areas. **Table 4.6** provides a brief description of each sub-catchment as well as the design parameters used in the hydrologic modeling. **MTE Drawing P-SW1.1** (enclosed) provides an illustration of the sub-catchment areas.

Table 4.6 – Post-Development Sub-Catchment Parameters

Sub-Catchment	Description	Area (ha.)	% Impervious [4]	Pervious Flow Length (m) [4]	Impervious Flow Length (m) [4]	Pervious Slope (%) [4]	Impervious Slope (%) [4]	Pervious CN [1]
135	Woodlot draining to Sheldon Creek Tributary at POI-12	0.71	0					85
136	Woodlot draining to Sheldon Creek Tributary at POI-12	1.92	0					85

4.8 Stormwater Management Design

4.8.1 Stormwater Quality Control

Two Wet Pond SWM facilities are proposed to provide water quality and quantity control treatment for runoff from the Subject Lands. Wet pond SWM facilities offer the benefits of dilution and settling of sediment within the forebay and the wet pond components. During the detailed design stage, a planting scheme will be prepared that carefully selects plant species and their location in and around the basin to stabilize banks, mitigate temperature increases, deter waterfowl from nesting within the area, and provide aesthetic and safety benefits.

The proposed SWM facilities each include a sediment forebay and a main pool. The sediment forebay will accept minor storm event flows originating from the majority of the Subject Lands. Major storm flows are diverted around the sediment forebay to avoid resuspension of solids.

The sediment forebays will be located at the inlet points to the facilities. The sediment forebay in SWMF1 will have maximum and minimum depths of 1.7m and 0.85mm, respectively. The sediment forebay in SWMF2 will have maximum and minimum depths of 1.5m and 0.75m, respectively. The maximum design depth would be available immediately following construction and after sediment clean-out operations. The minimum design operating depth is that which occurs prior to the required clean-out operations. Maintenance of the top portion of the forebay at all points in the sediment accumulation / clean-out cycle minimizes the potential for scour and re-suspension of previously settled sediments. The wet pond portion of SWMF1 has been designed with a 1.2m and SWMF2 has been designed with a 1.0m deep permanent pool feature.

Since the majority of annual rainfall (90th percentile) occurs in storms less than or equal to a 25mm event, the majority of water borne sediment is also transported to the SWM facility in these less intense events. Therefore, the sediment forebays are designed targeting the smaller flows. Furthermore, since larger storm events will have greater peak flows, there is potential for resuspension of accumulated sediment. Thus, the smaller flows into the forebay should be separated from the larger flows which should enter the main pond directly. To achieve this objective, the overland (major) flow route bypasses the sediment forebay and enters the main pool directly, which will be design at detailed design stage.

Forebay design is based on particle settling and flow dispersion equations as presented in the MOE 2003 Stormwater Management Practices Planning and Design Manual. The methodology presented in that document suggests that the design flow for the forebay should be taken as the peak outflow from the facility. Sediment forebay design calculations are included in **Appendix C**.

The clean-out frequency for the proposed SWM facilities can be found in the forebay design calculations in **Appendix C**.

Based on the MOE's 2003 Stormwater Management Guidelines, an Enhanced Level of water quality protection is required. Quality control measures proposed will take the form of wet pond SWM facilities. **Table 4.7** outlines the proposed SWMF1 and SWMF2 SWM facility designs. **Appendix C** includes main pond draw down calculations.

Table 4.7 – SWM Facility Water Quality Control Details

General	Pond Characteristics	
	SWMF1	SWMF2
Wet Pond Stormwater Management Facility	Enhanced Quality Control	Enhanced Quality Control
Total Contributing Area	38.99 ha	22.31 ha
Imperviousness	66.30%	42.49%
Main Pool Bottom Elevation	129.20m	125.50m
Average Pond Side Slopes (below Top of Freeboard)	5:1 H:V	5:1 H:V
Storage		
Unitary Storage Volume Requirements as per SWMMP (MOE 2003)	216.4 m^3/ha	158.7 m^3/ha
Required Total Volume	8,436 m^3	3,541 m^3
Permanent Pool		
Required Permanent Pool Volume	6,876 m^3	2,649 m^3
Permanent Pool Volume Provided		
Forebay	3,820 m^3	834.4 m^3
Main Pool	27,748 m^3	2,369.6 m^3
Total	31,568 m^3	3,204 m^3
Permanent Pool Elevation	131.20 m	126.50m
Extended Detention		
Minimum Required Volume (based on 40 m^3/ha)	1,560 m^3	892 m^3
Extended Detention Volume Provided	3,060 m^3	2,983 m^3
Approximate Drawdown Time	46.7 hr	46.4 hr
Extended Detention Elevation	132.38 m	127.90 m
Peak Release Rate for Extended Detention (Quality)	0.050 m^3/s	0.086m^3/s
Sediment Forebays		
Required Forebay Length	52.48 m	24.64 m
Actual Forebay Length	60.0 m	25 m
Permanent Pool Elevation	131.20 m	126.50 m
Bottom Elevation	129.20 m	125.00 m
Cleanout Frequency (to 50% sediment accumulation depth)	15.4 years	17.8 years
Outlet Controls		
Orifice 1 (Extended Detention) Diameter	345mm	230mm
Orifice 1 Invert Elevation	131.20 m	126.50 m
Orifice 2 Diameter	150 mm	680 mm
Orifice 2 Invert Elevation	131.50 m	127.60 m

General	Pond Characteristics	
	SWMF1	SWMF2
Orifice 3 Diameter	400 mm	-
Orifice 3 Invert Elevation	131.20 m	-
Weir Crest Breadth	-	4.2 m
Weir Crest Elevation	-	129.20 m
Weir Side Slopes (below top of freeboard elevation)	3:1 H:V	3:1 H:V

4.8.2 Stormwater Quantity Control

Storm sewers throughout the Subject Lands have been designed to convey the minor (5-year) storm event to the downstream SWM facilities SWMF1 and SWMF2. Major flow greater than the capacity of the storm sewer system will be conveyed to SWM facilities via overland flow routes along proposed roadways. Due to grading constraints, runoff from Block 226 cannot be directed to the proposed SWMF1 facility. On-site SWMF2 is proposed within the block as discussed further below.

Key considerations for discharge from the proposed SWM facilities and a description of the controls included therein are provided in the following sections.

4.8.2.1 SWMF1

Pond SWMF1 is located west of the realigned tributary, just upstream of POI-19, POI-20 and POI-28. Flows to all three of these POIs confluence approximately 180m downstream at POI-23 just upstream of Mainway.

POI-28, at the upstream end of headwater drainage feature (HDF) SCT-13, discharges to wetland SCW-4. It is required that sufficient flow is provided to this location to maintain this wetland under post-development. However, because SCW-4 spills directly into SCEB, no negative impact to SCW-4 would be expected if the target flow rate is exceeded.

SWMF1 and its outlet structure have been designed to provide Enhanced water quality treatment, and to ensure that target discharge rates are provided to POI-28 and further downstream at POI-23 for all storm events including the Regional storm.

The outlet from SWMF1 includes a box outlet structure with a total of three (3) inlets and one outlet. Orifice 1 , Orifice 2 and a weir control flow from the main pool of the pond into the outlet box structure, Orifice 3 controls flow out of the outlet box structure to the downstream watercourse. Orifice 1 is 345mm diameter in size, set at an elevation of 131.20m and is designed to control the 25mm WQ storm event. Orifice 2 is 150mm diameter in size, set at an elevation of 131.50m and is designed to control the 2-year to 100-year design storm events. The crest of the box structure is set at the 100-year water surface elevation of 132.50m, and acts as a wide-crested weir, allowing uncontrolled flow under the Regional storm event to enter the outlet box structure. Orifice 3, located on the downstream side of the box structure, has a diameter of 400mm and an invert elevation of 131.20m, and is designed to control the Regional storm flow out of the box structure. An emergency overflow spillway is provided at the top of the pond berm away from the outlet structure, and has a weir crest elevation set at the Regional storm water surface elevation.The box outlet structure discharge pipe is designed to convey all design storm flows to the realigned Sheldon Creek East Tributary channel and POI-21. The configuration of the outlet structure is shown on **Drawing P-SW1.3 – Preliminary SWM Pond SWMF1**.

Stage-storage-discharge (SSD) relationships for SWMF1 are shown below in **Table 4.8**. Detailed SSD relations are provided in **Appendix C**.

Table 4.8 – Stage-Storage-Discharge Information – Pond SWMF1

Elevation (m)	Discharge (m^3/s)	Live Storage Volume (m^3)	Remarks
131.20	0	0	Permanent Pool Elevation; 345mm dia. Orifice Invert (2 to 100-yr storm events); 400mm dia. Orifice Invert (100-yr & Regional storm events)
131.50	0.093	5,687	Enhanced WQ Storage Volume; 150mm dia. orifice.
131.80	0.194	11,636	
132.10	0.258	17,854	Weir spilling into Outlet Box Structure
132.40	0.309	24,344	
132.70	0.400	31,110	
133.00	0.444	38,158	
133.30	0.483	45,492	
133.70	0.532	55,662	Top of Freeboard

4.8.2.2 SWMF2

Pond SWMF2 is located east of SCWB, just upstream of POI-15 and POI-11. It is important to mimic the pre-development flow rate to each of these POIs in the post-development case.

Discharge from wetlands SCW-1. SCW-2 and SCW-3 enter the Employment Block via HDF SCT-6b, SCT-11, SCT-10b. It is necessary to maintain the flow from the upstream wetlands through the Employment Block to avoid negative impacts to the wetlands, although it is understood that protection of the minor tributaries is not necessary or beneficial. As such, development of the Employment Block may include conveyance of the upstream flows via enclosed sewers or open channels.

SWMF2 and its outlet structure have been designed to provide Enhanced water quality treatment, and to ensure that target discharge rates are provided to POI-15 and POI-11. SWMF2 includes a multi-stage outlet to control the total peak flow out of the facility to within allowable release rates at POI-15 and POI-11.

The discharge rate from the pond to the outlet structure is controlled by a 230mm diameter orifice which provides water quality control and discharges to the existing 750mm diameter storm sewer on Mainway at POI-11. A second 680mm diameter orifice provides additional quantity control and discharges to Sheldon Creek west branch at POI-15. In addition to these orifices, a 4.2m wide weir discharges directly to POI-15. The configuration of the outlet structure is shown on **Drawing P-SW1.3-Preliminary SWM pond SWMF2.**

The stage-storage-discharge (SSD) relationship for SWMF2 is shown below in **Table 4.9.** Detailed SSD relations are provided in **Appendix C.**

Table 4.9 – Stage-Storage-Discharge Information – Pond SWMF2

Elevation (m)	Discharge (m^3/s)	Live Storage Volume (m^3)	Remarks
126.50	0	0	Permanent Pool Elevation; 230mm dia. Orifice Invert
127.12	0.081	2,732	Enhanced WQ Storage Volume
127.60	0.1151	5,247	680mm dia. Orifice Invert

129.50	2.482	19,059	Top of Freeboard

4.8.3 Hydrologic Modeling

Hydrologic models were developed to provide quantitative estimates of flows across the study area under existing and proposed development conditions. The rainfall event simulation VO model was used to simulate response to the 25 mm Water Quality event using a 4-hour Chicago storm distribution 2-, 5-, 10-, 25-, 50- and 100-year return period design storm events using a 12 hour SCS rainfall distribution and City of Burlington intensity-duration-frequency parameters, and the Hurricane Hazel (last 12 hours; AMC Condition III) as was done in the pre-development modeling. Post-development VO modelling output is included in **Appendix "D"**, along with a hydrologic connectivity schematic.

Post-development hydrologic modeling results are summarized in **Table 4.10**.

Table 4.10 – Post-Development Peak Flow (m^3/s)

POI	Rainfall Event							
	25mm WQ	2-Year	5-Year	10-Year	25-Year	50-Year	100-Year	Regional
2	0	0	0	0	0	0	0	0
3	0	0	0	0	0	0	0	0
4	0.019	0.044	0.067	0.084	0.105	0.121	0.137	0.096
5	0.086	0.164	0.395	0.564	0.786	0.909	1.011	3.023
6	0.172	0.197	0.222	0.239	0.261	0.278	0.294	0.238
7	0.127	0.196	0.265	0.317	0.392	0.449	0.505	0.441
8	0.123	0.186	0.248	0.290	0.347	0.396	0.445	0.381
9	0.382	0.393	0.404	0.411	0.421	0.429	0.436	0.415
10	0.405	0.447	0.489	0.518	0.556	0.585	0.613	0.560
11	0	0	0	0	0	0	0	0
12	0.030	0.071	0.110	0.137	0.172	0.199	0.225	0.183
Total Discharging Directly to Sheldon Creek West Branch	0.019	0.044	0.067	0.084	0.105	0.121	0.137	0.096
Total Discharging toward Sheldon Creek via all Routes	0.726	1.838	3.450	4.350	5.204	5.851	6.417	9.628

Peak flow exceedances are observed at POI-5 when comparing post-development (the proposed SWMF2 outlet location) to pre-development (uncontrolled overland drainage from ploughed lands) conditions for all design storm events. Per the SSWS (Ref. 18), post-development peak flow rates do not exceed pre-development peak flow rates at POI-16 and POI-17 located on Sheldon Creek West Branch further downstream in the ultimate condition. Thus, the exceedances at POI-5 are localized, acceptable and will not have any negative impacts on any existing downstream developments.

Peak flow exceedances are observed at POI-6 to POI-10 when comparing post-development to pre-development conditions during the 25mm water quality and 2-year design storm events. These exceedances are required in order to meet pre-development surface water recharge targets to SCW-1, SCW-2 and SCW-3. Given the exceedance is only observed during these minor storm events and not during the remaining storm events (5 to 100-year and Regional) as well as the SSWS (Ref. 18) similarly shows no detrimental impacts to existing downstream developments, these exceedances are considered localized and acceptable.

Data associated with the performance of the SWM facilities is included in **Tables 4.11 and 4.12**.

Table 4.11 – SWMF1 Performance Data

Storm Event	Max. Ponding Elevation (m)	Max. Detention Depth (m)	Max. Storage Volume Used (m^3)
25mm WQ	131.35	0.15	3,060
2 Year	131.55	0.35	6,730
5 Year	131.69	0.49	9,440

Regional	129.50	3.00	19,060

5.0 MONTHLY WATER BALANCE

Based on the Bronte Creek Meadows Scoped Subwatershed Study (MTE, February 2026), the recommended water balance criteria for the study area are as follows:

Wetland SCW-2 was observed to have standing water year around. While overwintering by frogs and turtles was not observed, the permanent pool does make overwintering possible. In order to maintain the year around pool in SCW-2, the water budget criterion for wetland SCW-2 is to maintain a post- to pre-development annual surface water recharge balance.

Other wetlands (SCW-1 and SCW-3) have not been observed to hold water through the winter months, and so it is more important to provide a balance in the months.

The water budget criterion for wetlands SCW-1 and SCW-3, then, is to provide a post- to pre-development surface water recharge balance during the summer months.

The report noted all wetlands were considered to be surface water fed with little to no inputs from groundwater aquifers. For wetlands with a pre-development catchment boundary that extended into the development lands (i.e. SCW-1 and SCW-3), water balance criteria will be met through the implementation of “third pipe” storm sewer networks that collect clean roof water and convey flows to the wetlands.

A continuous simulation was conducted with the developed model using a 31-year (1985 to 2015) meteorological data set recorded at the Royal Botanical Gardens in Burlington. This gauge is approximately 15km to the southwest of the Study Area and is considered to be representative of typical conditions for the Study Area.

Discretization of pre-development catchments from which runoff enters each of these wetlands is described in the Bronte Creek Meadows Scoped Subwatershed Study Report (dated September 2025), under separate cover. The pre-development annual surface water contribution to each of these wetlands, on a monthly basis, has been established using continuous hydrologic modeling and the 31-year data set.

5.1 Pre-Development Surface Water Budget

Pre-development surface water budget values for the Sheldon Creek Wetlands are listed in **Table 5.1**.

Table 5.1 – Pre-Development Surface Water Budget – Sheldon Creek Wetlands

Month	Wetland SCW-1	Wetland SCW-2	Wetland SCW-3	Wetland SCW-3 (Middle)
	Runoff (m^3)	Runoff (m^3)	Runoff (m^3)	Runoff (m^3)
January	1,679	1,888	2,664	3,8833,831
February	1,966	2,211	3,120	4,5474,486
March	2,434	2,738	3,863	5,6315,556
April	1,803	2,028	2,861	4,1704,115

November	1,303	1,466	2,068	3,0142,974
December	1,475	1,659	2,341	3,4123,367
Annual Total	16,634	18,709	26,397	38,47337,963

5.2 Post-Development Surface Water Budget

Maintenance of surface water contribution to the various wetlands downstream of development areas is important to ensure the long-term viability of the wetlands. Roof water collection systems and “third pipe” storm sewer networks will be implemented to collect, convey and discharge clean roof water to supplement surface water recharge deficits for wetlands SCW-1 and SCW-3. This mitigation strategy allows the proposed development to meet post- to pre-development water recharge balance requirements as defined above.

Post-development surface water budget values for the Sheldon Creek wetlands are listed in **Table 5.2**.

Table 5.2– Post-Development Surface Water Budget – Sheldon Creek Wetlands

Month	Wetland SCW-1	Wetland SCW-2	Wetland SCW-3	Wetland SCW-3 (Middle)
	Runoff (m^3)	Runoff (m^3)	Runoff (m^3)	Runoff (m^3)
January	1,574,1749	1,7841,959	1,9032,094	2,6452,836

Annual Total	26,397	27,557	1160	37,963	34,905	-3,058

Wetland SCW-2 is fed from SCW-1, therefore in order to provide the necessary annual surface water recharge balance at SCW-2, an annual recharge balance is also provided at SCW-1.

As demonstrated above, a post- to pre-development annual surface water recharge balance is achieved for wetlands SCW-1 and SCW-2, and a post- to pre-development surface water recharge balance during the summer months is achieved at wetlands SCW-3 and SCW-4.

6.0 Monitoring Program

6.1 During Development Monitoring Program

In accordance with the recommendations of the MESP a During Development Monitoring Program associated with the development has been designed for implementation by the developer and is divided into three components:

- Pre-Construction Monitoring
- During-Construction Monitoring
- Post-Construction Monitoring

The During-Development Monitoring Program includes monitoring programs for groundwater, surface water, wetland features and biological features.

- The groundwater monitoring program includes water level (continuous and manual measurements) and annual chemistry testing for general water quality including metals and nutrients.
- The surface water monitoring program includes continuous temperature monitoring and seasonal base and storm quality sampling samples including TSS, chlorides, nutrients, metals, and bacteria.
- The wetland monitoring program includes water level and seasonal quality samples including total phosphorus, nitrogen and chlorides.
- Biological monitoring has been completed by Colucent and includes wildlife monitoring and vegetation units. For additional details of the biological monitoring refer to Colucent's EIA.

Table 6.1 summarizes the various components of the monitoring program along with specific locations parameters frequency and status. **Figure 6.1** displays monitoring and sampling locations.

6.1.1 Pre-Construction Monitoring Program

The Pre-construction monitoring program was developed with reference to the MESP and subsequent input from relevant agencies (City, Region, CH). This portion of the monitoring is intended to establish detailed site background conditions and baseline data. This information will facilitate comparison with conditions during and following construction and allow an evaluation of the mitigation measures. The pre-construction monitoring program includes the following parameters:

- **Groundwater** – monitoring includes levels, general chemistry, metals and nutrients.
- **Surface Water Quality** – parameters include general chemistry, metals and nutrients.
- **Wetlands** – monitoring includes levels, general chemistry, metals and nutrients.
- **Ecology / Biology** – including preparation of an Ecological Rewilding, Adaptive Management and Monitoring Plan for lands to be conserved, restored, and protected in a post-development setting.
- **Streambank Stability** – baseline monitoring.

6.1.2 During-Construction Monitoring Program

The purpose of this stage of the monitoring is to continue with the pre-construction monitoring program in order to monitor the effectiveness of erosion and sediment control measures, and to confirm that mitigative measures are functioning properly. The proper function of SWM measures during construction is also critical. Additional monitoring (over and above the pre-construction program) will include:

- **SWM Facility Monitoring**

SWMF1

- Standard inspection of vegetation, structures, and general operation of hydraulic controls (observations of drawdown) within the stormwater management facility. These inspections are to occur seasonally and typically after a significant rainfall event.
- Regular inspection and maintenance of erosion and sediment control measures around and within the facility.
- Inspection of the regraded Sheldon Creek East Branch to ensure it is sufficiently distributing the peak flow from the facility.

SWMF2

- Standard inspection of vegetation, structures, and general operation of hydraulic controls (observations of drawdown) within the stormwater management facility. These inspections are to occur seasonally and typically after a significant rainfall event.
- Regular inspection and maintenance of erosion and sediment control measures around and within the facility.

A detailed SWM facility Operations & Maintenance Manual will be prepared for each SWM facility at the final design stage.

- **Erosion and Sediment Control** – per ESC plans.

This stage will begin at the commencement of area grading of the subdivision and will continue until 90% stabilization of the SWM Facility contributing catchment area is achieved (houses are constructed, lots are sodded). Annual reports are to be submitted, summarizing the data collected along with any conclusions, to the City, and Conservation Halton.

6.1.3 Post-Construction Monitoring Program

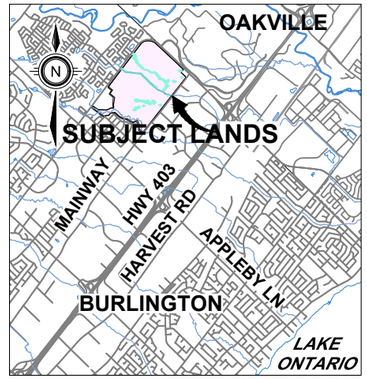
This period of monitoring will begin following 90% stabilization of the contributing catchment area to the SWM Facility. The purpose of this stage of the monitoring is to evaluate the performance of the constructed SWM Facilities under “ultimate” operating conditions. The post-construction monitoring period will extend for a 2-year period. Monitoring during this stage will include all components from the pre-construction and during-construction monitoring program.

Additional monitoring (over and above the during-construction program) will include:

- **Stormwater Management Facility** – winter by-pass valves would be typically operated between December 1 and March 31 (winter months), however the timing may differ year to year depending on weather and climatic conditions. Weather conditions should be monitored in late fall and early spring to determine valve operation.
- **Streambank Stability** – final condition monitoring.

It is recommended that following completion of the developer's portion of the post-construction monitoring program and assumption of the stormwater management facilities by the City, the City continues with a post-development inspection and maintenance program to ensure the long-term effectiveness of the proposed stormwater management facilities (including conveyance facilities and winter by-pass operation).

Table 6.1– Monitoring Program



SURFACE AND GROUNDWATER MONITORING PROGRAM - BRONTE CREEK MEADOWS SUBDIVISION

Monitoring Component	Type of Monitoring	Development Phase	Sampling Frequency	Location(s)	Methodology / Timing
SWM Facilities	Water Quality	During/Post-Construction	Event-based (>15mm rain events)	Outlet of SWMF1, SWMF2, SWMF3	TSS samples captured seasonally following significant rainfall event (>15mm).
Wetlands	Water Levels	All	Continuous (1 hour interval)	SCW-1 (MP107-23, SG107-23), SCW-2 (MP103-23, SG103-23), SCW-3 (MP103-23, SG103-23), SCW-4 (MP102-23, SG102-23), Sheldon Creek (MP105-23, MP106-23, SG105-23, SG106-23), Sheldon Creek Tributary (MP101-23, SG101-23. SG102-23), Bronte Creek Tributary / BCW-1 (MP104-23, SG104-23)	Water levels will be continuously measured with recordings taken every 1 hour.
	Water Quality (General Chemistry)	All	Seasonally (spring, summer, fall)	SCW-1 (MP107-23, SG107-23), SCW-2 (MP103-23, SG103-23), SCW-3 (MP103-23, SG103-23)	Manual samples collected seasonally during dry weather (minimum 48 hours of no rainfall) and following significant rainfall events (>15mm in 24 hours). Wetland samples collected from both surface water and groundwater.
Surface Watercourses	Water Quality (TSS, Cl, TKN, NO_3, NO_2, TP, E.Coli, Fecal Coliform, Total and Dissolved Metals, DO)	All	Seasonally (spring, summer, fall)	Sheldon Creek - 105Q, 106Q Bronte Creek Tributary - 109Q, 111Q Sheldon Creek Tributary - 114Q, 110Q	Manual samples collected seasonally during dry weather (minimum 48 hours of no rainfall) and following significant rainfall events (>15mm in 24 hours).
	Water Levels and Temperature	All	Continuous (15 minute interval)	Sheldon Creek - SG105-23, SG106-23 Bronte Creek Tributary - 109P-A/B, 111P, 112P Sheldon Creek Tributary - 114P-A/B, 110P Burloak Dr Culvert - 113P	Water levels will be continuously measured with recordings taken every 1 hour (SG105-23, SG106-23) and 15 minute intervals at all other stations.
Groundwater	Water Levels	Pre-Construction	Continuous (1 hour interval)	MW101-23 - MW110-23	Water levels continuously measured with recordings taken every 1 hour.
		During/Post-Construction	Continuous (1 hour interval)	MW101-23 - MW110-24	Water levels continuously measured with recordings taken every 1 hour.
	Water Quality (General Chemistry)	Pre-Construction	Annually	MW101-23, MW102-23, MW103-23, MW104-24, MW105-23, MW106-23, MW107-23, MW108-23, MW109-23, MW110-23	Sampled on an annual basis and analyzed for general chemistry parameters (including major anions, cations, nutrients, metals, pH, conductivity, ammonia, chlorides, e-coli and total coliforms).
		During/Post-Construction	Annually	MW102-23, MW105-23, MW107-23	Same as Pre-Construction
Ecological	Vegetation	All		Refer to *Environmental Impact Assessment Report* prepared by Colucent Environmental	
	Wildlife Passage	During/Post-Construction		Refer to *Environmental Impact Assessment Report* prepared by Colucent Environmental	
	Buffer Integrity and Function	Post-Construction		Refer to *Environmental Impact Assessment Report* prepared by Colucent Environmental

7.0 EROSION AND SEDIMENT CONTROL MEASURES

Erosion & sediment control measures for the development are described in the Functional Servicing Report for the project, submitted herewith.

8.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the foregoing analysis, it is concluded that:

i. The flood control target is met by controlling post-development peak flows to within pre-development levels through the implementation of two wet pond SWM facilities.

ii. The erosion control target is met through the proposed SWM facilities, which have drawdown times less than 48 hours.

iii. Due to shallow bedrock, shallow groundwater and impermeable native soils, the use of subsurface LID measures such as soakaway pits and bioretention swales is not feasible.

iv. Enhanced (80% TSS removal) water quality treatment is provided by the wet pond SWM facilities.

v. Post-development peak flow rates to existing storm inlets and sewers at various locations around the site are controlled to within pre-development levels by both wet pond SWM facilities.

vi. Post-development peak flow rates to existing natural heritage system features (i.e. wetlands) surrounding the site are controlled to pre-development levels using multi-stage outlets from the proposed SWM facilities.

vii. Surface water contributions to wetlands SCW-1, SCW-2, SCW-3 and SCW-4 are maintained and enhanced under post-development conditions.

Based on the above conclusions, it is recommended:

i. That the SWM measures described in this report be implemented to provide flood, erosion, water quality and quantity controls.

ii. That Draft Plan Approval of the subject lands be granted by the City of Burlington, in order that the project may proceed to the detailed design stage.

All of which is respectfully submitted,

TOTAL AREA (CURRENT)			**207.56**												
TOTAL AREA (GREENFIELD)			**120.35**												

Notes

1. Pervious Initial Abstraction (Perv. Ia) = 0.1 x S , where S = (25400 / CN) - 254
2. Depression Storage over Impervious areas (DPSI) = 2.0 mm
3. Hydraulic Soil Classification = C, based on Sandy Silt / Silty Sand soils.
4. The following catchments in the table above are excluded form the Current Conditions modelling and total area: EXT-11, EXT-12, EXT-13, EXT-13A, EXT-13B, EXT-15
5. The following catchments in the table above are included in the Greenfield Conditions modelling and total area: EXT-1, EXT-2, EXT-11, EXT-12, EXT-13, EXT-13A, EXT13-B, EXT-15, EXT-16, EXT-19, EXT-20, EXT-21, 101, 120, 124, 125, 126, 127, 129,130, 131

PRELIMINARY STORMWATER MANAGEMENT
Phase 1 Conditions

Time to Peak Calculations

Time to peak (T_p) values were derived from time of concentration (T_c) calculations based on the Airport Method equation:

$$T_c = \frac{3.26(1.1-C)L^{0.5}}{S_w^{0.33}}$$ (MTO Dainage Manual Design Chart 1.12)

T_c = Overland flow time of concentration (minutes)
L = Flow travel length
S = Basin slope (%)
C = Runoff coefficient

From this, **$T_p = 0.67\ T_c$**

The time to peak values used in the NASHYD command for the hydrologic modeling are shown below:

Catchment ID	Area (ha)	Length (m)	'C'	Slope (m/m)	T_c (min)	T_p (min)	T_p (hrs)	Development Condition	Notes
