KUNTZ FORESTRY CONSULTING INC Project P4342

1. Introduction

Kuntz Forestry Consulting Inc. (KFCI) was retained by Alinea to complete a Tree Inventory and Preservation Plan and Edge Management Plan Report as part of a development application for the property located at Bronte Creek Meadows in Burlington, Ontario. The site is located within a mixed use area.

The work plan for this tree preservation study included the following:

- Prepare an inventory of the tree resources measuring 10cm diameter at breast height (DBH) and greater on and within six metres of the subject property with the potential to be impacted by the proposed works;
- Evaluate potential tree saving opportunities based on the proposed works;
- Evaluation restoration opportunities and prepare recommendations for edge management; and
- Document the findings in a Tree Inventory and Preservation Plan Report.

The results of the evaluation are provided below.

2. Methodology

2.1. Tree Inventory

The tree inventory was conducted on 30 June 2025, 2, 7, 8, 10, 16 and 21 July 2025. KFCI's Trimble GPS unit was used to locate tree resources. Trees measuring 10cm DBH and greater on and within six metres of the disturbance limit with the potential to be impacted by the proposed works were included in the tree inventory. Trees were tagged with identification numbers, which are referenced in Table 1 and illustrated in Figure 1.

Individual tree resources were assessed utilizing the following parameters:

Tree # – Number assigned to trees that corresponds to Figure 1.
Species – Common and botanical names provided in the inventory table.
DBH – Diameter (centimetres) at breast height, measured at 1.4 metres above the ground.
Condition – Condition of tree considering trunk integrity (TI), crown structure (CS) and crown vigor (CV). Condition ratings include poor (P), fair (F), and good (G).
Crown Dieback – Percentage of dead branches within the crown.
Dripline – Crown radius (metres).
Comments – Any other relevant tree condition information.

Refer to Table 1 for the tree inventory. Tree locations are shown on Figure 1.

2.2. Edge Management

During field investigations, the vegetation types and plant associations within the adjacent communities were visually assessed to help guide appropriate restoration measures. Existing ecological conditions and potential restoration opportunities along the forest edge were also evaluated. The Ecological Land Classification (ELC) for the natural heritage features impacted by the proposed development was completed and documented in an EIS completed by Terrastory environmental consulting inc. (2024). These classifications,

together with field observations, informed the development of suitable planting recommendations.

Hazard trees within striking distance of the proposed development were also identified during field investigations and are shown on Figure 1.

3. Existing Site Conditions

The subject area is currently characterized by a mix of agricultural land and natural heritage features, including woodlands, wetlands, and thicket communities. A comprehensive description of these natural features is provided the EIS completed by Terrastory environmental consulting inc. (2024).

4. Individual Tree Resources

The inventory documented 1171 individual trees on and within six metres of the proposed disturbance limit. Refer to Table 1 for the full tree inventory and Figure 1 for the locations of trees reported in the tree inventory.

Tree resources were comprised of American Beech (Fagus grandifolia), Apple (*Malus spp.*), Basswood (*Tilia americana*), Bitternut Hickory (*Carya cordiformis*), Black Cherry (Prunus serotina), Black Walnut (Juglans nigra), Bur Oak (Quercus macrocarpa), Cherry Species (Prunus spp.), Green Ash (Fraxinus pennsylvanica), Ironwood (*Ostrya virginiana*), Manitoba Maple (*Acer negundo*), Norway Maple (*Acer platanoides*), Red Maple (*Acer rubrum*), Red Oak (*Quercus rubra*), Shagbark Hickory (*Carya ovata*), Silver Maple (*Acer saccharinum*), Sugar Maple (*Acer saccharum*), Swamp White Oak (*Quercus bicolor*), Sweet Cherry (*Prunus avium*), White Ash (*Fraxinus americana*), White Elm (*Ulmus americana*), White Oak (*Quercus alba*), White Pine (*Pinus strobus*), and Willow (*Salix spp*.)

5. Proposed Development

A mixed-use development is proposed for the site, consisting of residential blocks, a school, an employment block, a stormwater management pond, and a network of streets providing access to Mainway and Corporate Drive. Refer to Figure 1 for the existing conditions and proposed site plan.

6. Discussion

The following sections provide a discussion and analysis of development impacts, tree removal requirements, and tree preservation relative to the proposed development and existing conditions.

6.1. Development Impacts/Tree Removals

The proposed development will necessitate the removal of 64 trees. These trees cannot be retained due to direct conflicts with the proposed crossing through natural heritage system. Detailed inventory information for the trees proposed for removal is provided in Table 1.

Trees located within 15 metres of the downstream portion of the Sheldon Creek tributary were inventoried. Excavation required for functional servicing is anticipated within this area, and tree removals may be necessary to accommodate the proposed work. Tree preservation/ removal recommendations may change pending detailed site servicing/grading plans.

Refer to Figure 1 for the location of proposed tree removals.

6.2. Tree Preservation

The preservation of 1107 trees will be possible with the use of appropriate tree protection measures as indicated on Figure 1. Tree protection measures will have to be implemented prior to construction to ensure designated tree resources are not impacted by the development. Silt control fence will suffice as tree preservation fence. Refer to Figure 1 for the location of required tree preservation fencing, preservation planning notes, and the preservation fencing detail.

6.3. Monitoring

Monitoring of tree protection measures should occur daily by site staff and monthly by an Arborist or Forester throughout the duration of construction. Any required repairs are to be completed within 48 hours. The visits should be documented and additional protection and/or mitigation measures recommended upon each visit implemented and confirmed with the supervising Arborist or Forester.

7. Edge Management Recommendations

7.1. Management Objectives

The proposed edge management areas include the interfaces between the proposed development and the existing natural heritage features adjacent to the proposed development. Existing and new forest edge health may be improved through the implementation of appropriate management strategies, described below. The purpose of the Edge Management Plan is to mitigate for impacts as a result of the newly created edges and increase the buffering capacity of the existing natural edge as it interfaces with the proposed development.

The ecological integrity of the natural heritage features' edges is dependent upon the development and implementation of appropriate management strategies. Key opportunities identified for the woodland edge that impact its long-term ecological integrity include the management of invasive species and the planting of native plant assemblages to achieve as natural a state as possible. Established forest edge communities are an integral component of forest health providing necessary buffering qualities to interior forest habitat. Management and restoration of the edges is necessary to restore and enhance the structure and function of the existing natural heritage feature while minimizing impacts to the forest and wetland communities from the proposed development. The following sections include implementation strategies for satisfying the objectives.

The edge management areas occur within or adjacent to existing forest communities (FODM5-3, FODM2, and FODM7-2). For a detailed description of the ecological units

associated with the site, refer to the *Existing Conditions Report completed by Terrastory environmental consulting inc. (2024)* and the *Environmental Impact Assessment Report completed by Colucent Environmental (2026)*. Recommendations for the Edge Management Plan have been developed based on the ecological descriptions within these reports and observations made in-field by KFCI.

Refer to Appendix A for detailed Edge Management Prescriptions and Figure 2 for Restoration Area locations.

7.2. Implementation Strategy

7.2.1. Hazard Tree Assessment

Hazard trees within striking distance of the disturbance limit were identified during field investigations and are noted on Figure 1 to this report in orange. A total of 55 dead/hazardous trees outside of the disturbance limit were noted. Refer to Figure 1 for the locations of these trees.

7.2.2. Invasive Species Management

In many of the edge management treatment areas, Common Buckthorn (*Rhamnus cathartica*) has heavily invaded the features including the edges. Proper removal and management of this invasive species will improve the floristic quality of the features and help increase the likelihood of establishment and success of native species plantings. Buckthorn should be managed by stem cutting for mature specimens, with a glyphosate-based herbicide applied immediately following cutting to suppress coppice growth. Smaller individuals can be hand pulled, taking care to remove the root as well. Buckthorn is most efficiently removed in fall/late fall when most other plants are entering dormancy to prevent any negative impacts on surrounding native species, although removal can occur in early spring as well, before seeds have formed. Buckthorn management is typically a multi-year effort and will likely require multiple interventions.

7.2.3. Edge Management Planting Area

The purpose of the edge planting plan is to improve the floristic quality and ecological integrity of the existing and newly created forest edges while providing long-term visual screening and effective windbreak functions. The edge planting plan will incorporate native tree, shrub, and herbaceous species appropriate to the identified vegetation community types and observations made in-field by KFCI. Multi-layered plantings forming distinct vegetation strata including canopy, understory, and ground layer should be implemented to emulate a natural forest structure. Microsites will be selected at the time of planting, based on site conditions and species compatibility. Where appropriate, the use of a native herbaceous seed mix is recommended to help establish all three vegetation layers.

To further support restoration objectives, mitigation measures in addition to planting are recommended particularly in high-traffic areas adjacent to newly exposed edges. These measures may include soil decompaction and soil amendment treatments to improve rooting conditions and long-term vegetation success. This may be required within Restoration Areas A1 and A2 – refer to Appendix A for details.

During detailed design, grading within areas where new forest edges will be created should be designed to meet existing grades at a minimum distance of 3 metres away from the dripline of trees to be retained, to the greatest extent possible. This will help minimize impacts to root zones of retained trees and support the health of adjacent natural features. Currently, the TPZ as discussed in section 6.2 is located at the edge of the block limits.

To minimize soil disturbance and root zone damage, stump grubbing should be avoided in areas directly adjacent to the newly created forest edge. Coarse woody debris may be retained on-site or mulch applied to enhance soil moisture retention, reduce compaction, and provide habitat structure.

Recommended tree, shrub, and herbaceous species will contribute to re-establishing natural forest structure and ecological function. It is advised that slower-growing tree species be planted closer to the existing forest edge, while faster-growing pioneer species be planted toward the development side to support succession. Species selection should be based on native nursery stock availability and suitability to existing site conditions.

7.3. Monitoring

Monitoring of the forest edge and designated planting areas following implementation of restoration initiatives is recommended to track the success of ecological restoration techniques and guide the short- and long-term maintenance of the restored features. A monitoring schedule involving periodic site inspections by a qualified arborist or other tree professional is recommended.

Monitoring events should occur twice during the growing season for a minimum of two years following the implementation of restoration plantings and initiatives. Due to the size of the forest edge, permanent plots or sample quadrants are not necessary for successful monitoring. Visual analysis incorporating detailed notes to address survivorship of plant species, individual plant health, and potential growth of invasive species is recommended. Mortality of all planted individuals should be determined and the causes of mortality identified (e.g., shade/sun intolerance, herbivory, drought). Removal and control of invasive species should be addressed during monitoring events to prevent establishment and spread.

Watering of planted stock should occur for two years during dry periods, and weed mats or brush blankets should be installed where abundant herbaceous competition arises to ensure the survivorship of planted species. In addition to the short-term monitoring measures, a long-term monitoring plan shall be implemented for a minimum of five years to assess planting success, site stability, and the overall effectiveness of restoration measures, with adaptive management actions taken as required.

8. Summary and Recommendations

Kuntz Forestry Consulting Inc. was retained by Alinea to complete a Tree Inventory and Preservation Plan and Edge Management Plan Report as part of a development application for the property located at Bronte Creek Meadows in Burlington, Ontario. A tree inventory was conducted and reviewed in the context of the proposed site plan.

The findings of the study indicate a total of 1,171 trees on and within six metres of the disturbance limit. The removal of 64 trees will be required to accommodate the proposed development. The preservation of all other tree resources will be possible provided appropriate tree protection measures are installed prior to demolition and construction.

The following recommendations are suggested to minimize impacts to trees identified for preservation. Refer to Figure 1 for the preservation fence detail and additional tree preservation notes.

- Tree protection barriers and fencing should be erected at locations prescribed on Figure 1.

- Tree protection measures will have to be implemented prior to demolition and construction to ensure the trees identified for preservation are not impacted by the development.

- Branches and roots that extend past prescribed tree protection zones that require pruning must be pruned by a qualified Arborist or other tree professional. All pruning of tree roots and branches must be in accordance with good arboricultural standards.

- Site visits, pre, during and post construction are recommended by either a certified consulting arborist (I.S.A.) or registered professional forester (R.P.F.) to ensure proper utilization of tree protection barriers. Trees should also be inspected for damage incurred during construction to ensure appropriate pruning or other mitigation measures are implemented.

Respectfully Submitted,

Kuntz Forestry Consulting Inc.

Disclaimer

Only the tree(s) identified in this report were included in the inventory. The assessment of the trees presented in this report has been made using accepted arboricultural techniques. These may include a visual examination taken from the ground of all the above-ground parts of the tree for structural defects, scars, external indications of decay such as fungal fruiting bodies, evidence of attack by insects, discoloured foliage, the condition of any visible root structures, the degree of lean (if any), the general condition of the trees and the identification of potentially hazardous trees or recommendations for removal (if applicable). Where trees could not be directly accessed (ie. due to obstructions, and/or on neighbouring properties), trees were assessed as accurately as possible from nearby vantage points.

Locations of trees provided in the report are determined as accurately as possible based on the best information available. If official survey information is not provided, tree locations in the report may not be exact. Where KFCI's in-house GPS unit is used (if applicable), tree locations are accurate only to the extent that the technology allows, which can be variable based on satellite available, RTK network / cell coverage, canopy coverage, and/or projection transformation limitations. If trees occur on or near property boundaries, an official site survey may be required to determine ownership utilizing specialized survey protocol to gain precise location.

Furthermore, recommendations made in this report are based on the site plans that have been provided at the time of reporting. These recommendations may no longer be applicable should changes be made to the site plan and/or grading, servicing, or landscaping plans following report submission.

Notwithstanding the recommendations and conclusions made in this report, it must be recognized that trees are living organisms, and their health and vigor constantly change over time. They are not immune to changes in site conditions or seasonal variations in the weather conditions. Any tree will fail if the forces applied to the tree exceed the strength of the tree or its parts.

Although every effort has been made to ensure that this assessment is reasonably accurate, the trees should be re-assessed periodically. The assessment presented in this report is valid at the time of inspection.

Appendix A: Edge Management Prescriptions

A1 – new edge to be created within FODM7-2 ELC unit:

1. Decompaction of disturbed soils, if required
2. Remove Buckthorn and other invasives along edge (10m from disturbance limit)
3. Plant Trees and shrubs as follows: Shrubs planted on 1.5m centres in groups of 5 to 10 (mixed species). Trees planted in groups of 3-5 (mixed species), on 5m centres considering vegetation already on site. Apply mulch to trees and shrubs.

Type	Botanical Name	Common Name	Condition
Trees	*Acer rubrum*	Red Maple	Trees to be a mix of seedling sizes and whips
	Ulmus americana	White Elm	
	Tilia americana	Basswood	
	Thuja occidentalis	Eastern White Cedar	
	Betula papyrifera	White Birch	
	Populus tremuloides	Trembling Aspen	
	Quercus macrocarpa	Bur Oak	
Shrubs	*Cornus sericea*	Red-osier Dogwood	1 or 2 gallon pots, min. 60cm height
	Viburnum lentago	Nannyberry	
	Ribes americanum	Wild Black Current	
	Prunus virginiana	Chokecherry	
	Hamammelis virginiana	Witch Hazel	
	Sambucus canadensis	Elderberry	
	Rubus odoratus	Purple-Flowering Raspberry	

Any disturbed soils in this area to be seeded with TRCA-SC-2 seed mix at rate of 21.51 kg/ha.

A2 – existing edge (previously impacted by servicing) to be enhanced adjacent to FODM2 ELC unit

1. Decompaction of newly disturbed soils, if required
2. Remove Buckthorn and other invasives within edge management area.

3. Plant trees and shrubs. Shrubs planted on 0.75-1.5m on centre in groups of 5-10 as follows and trees planted in groups of 3-5 (mixed species), on 5m centres considering vegetation already on site. Apply mulch to trees and shrubs.
4. Add coarse woody debris, sourced from tree removals.

Type	Botanical Name	Common Name	Condition
Trees	*Quercus rubra*	Red Oak	Trees to be a mix of seedling sizes and whips
	Acer saccharum	Sugar Maple	
	Carya ovata	Shagbark Hickory	
	Tilia americana	Basswood	
	White Oak	Quercus alba	
	Populus tremuloides	Trembling Aspen	
	Pinus strobus	White Pine	
Shrubs	*Cornus alternifolia*	Alternate-leaved Dogwood	1 or 2 gallon pots, min. 60cm height
	Hamamelis virginiana	American Witchhazel	
	Ribes americana	Red Current	
	Prunus virginiana	Chokecherry	
	Viburnum rafinesquianum	Downy Arrow-Wood	
	Sambucus canadensis	Elderberry	
	Rubus occidentalis	Black Raspberry	

Any disturbed soils in this area to be seeded with TRCA-SD-5 seed mix at rate of 13.57kg/ha.

A3 – existing edges to be retained along FODM2/FODM5-3 ELC Units

1. Remove Buckthorn and other invasives 10m into forest
2. Within Buckthorn removal area, plant shrubs 0.75-1.5m on centre in groups of 5-10 as follows.
3. Trees planted in groups of 3-5 (mixed species), on 5m centres considering vegetation already on site. Apply mulch to trees and shrubs.
4. Between existing edge of forest and grading limits, remove existing weedy herbaceous material, then plant trees, shrubs, and apply seed mix:
5. Add coarse woody debris, sourced from tree removals.

Type	Botanical Name	Common Name	Condition
Trees	*Quercus rubra*	Red Oak	Trees to be a mix of seedling sizes and whips
	Acer saccharum	Sugar Maple	
	Carya ovata	Shagbark Hickory	
	Tilia americana	Basswood	
	White Oak	Quercus alba	
	Populus tremuloides	Trembling Aspen	
	Pinus strobus	White Pine	
Shrubs	*Cornus alternifolia*	Alternate-leaved Dogwood	1 or 2 gallon pots, min. 60cm height
	Hamamelis virginiana	American Witchhazel	
	Ribes americana	Red Current	
	Prunus virginiana	Chokecherry	
	Viburnum rafinesquianum	Downy Arrow-Wood	
	Sambucus canadensis	Elderberry	
	Rubus occidentalis	Black Raspberry	

Any disturbed soils in this area to be seeded with TRCA-SD-5 seed mix at rate of 13.57kg/ha.
